All manuscripts utilizing data made available through the Zentralarchiv fuer empirische Sozialforschung should acknowledge that fact as well as identify the original collectors of the data. We kindly ask all users to follow some adaptation of the following statement:

The data utilized in this (publication) were documented and made available by the ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG, KOELN. The data for the 'ISSP' were collected by independent institutions in each country (e.g. the Australian survey was conducted by the NSSS at the Australian National University (J. Kelley, M. Evans, C. Bean) etc. - see explicit information about the authorship in the codebook section: Study Descriptions). Neither the original collectors nor the ZENTRALARCHIV bear any responsibility for the analyses or interpretation presented here

In order to provide funding agencies with essential information about the use of archival resources, and to facilitate the exchange of information about research activities based on the ZENTRALARCHIV's holdings, each user is expected to send two copies of each completed manuscript to the ZENTRALARCHIV.

Please note

All marginals in this documentation are calculated from

unweighted data

Please consider **also** that - especially in the section of the background variables - the same code-values do **not** always have the same meaning for each country. The differences are documented in this codebook.

An Introduction to the ISSP

The International Social Survey Programme (ISSP) is a voluntary grouping of study teams in eleven nations (soon to become thirteen or fourteen), each of which undertakes to run a short, annual self-completion survey containing an agreed set of questions asked of a probability-based, nation-wide sample of adults. The topics change from year to year by agreement, with a view to replication every five years or so. The questions themselves are developed by subgroups and then thrashed out at an annual meeting attended by representatives of each national team. At the last meeting in May 1989, in London, there were 29 participants from the 11 national teams, including representatives of the ISSP's 'official' data archive, the Zentralarchiv at the University of Cologne. A constitution of sorts has now been adopted by members of the ISSP. It contains, for instance, rules of entry for new members and responsibilities of membership. The primary duty of each member is, of course, to run every annual module (or at least nearly every one) in the agreed format. But there are no central funds for the ISSP: each national team covers the costs of its own piloting, fieldwork, data preparation, travel to meetings and so on. Since the ISSP has agreed to use one language for drafting and for meetings - (British) English - there are no central translation costs.

Improbable as it may seem, this general formula has worked well so far. The annual questionnaires for instance (contrary to all advice and experience) have actually been designed for the most part in committee, and though inevitably flawed, are no less successful than most. Admittedly, this success owes a lot to careful prior development work by drafting groups and to subsequent adjustments after piloting. In any event, fascinating data are already beginning to emerge.

A fuller treatment than is given here, of the results generated so far by the series, is to be provided in the first ISSP Report, a book funded by the European Cultural Foundation and due to be published by the Netherlands Social and Cultural Planning Bureau (SCP) in 1990.

As may by now be apparent, the ISSP has grown and developed somewhat haphazardly, and this pattern shows every sign of continuing as long as it seems to work. The ISSP certainly came into life without much serious planning, having emerged as a vague idea during an impromptu meeting the two of us in 1983 whose purpose was primarily to exchange experiences and explore opportunities for borrowing each other's questions.

At that stage, the British Social Attitudes Survey (BSAS) was still in its first year, but had just received news that it was to be given at least a four-year life span through the generosity of the Sainsbury Family Charitable Trusts. The US General Social Survey (GSS), in contrast, was some 12 years old and had already acted as something of a role-model for other national series, including the BSAS itself, the West German Allgemeine Bevoelkerungsumfrage der Sozialwissenschaften (ALLBUS) (started in 1980) and the Australian National Social Science Survey (NSSS) (which was about to take its first fieldwork round).

As is usual at such meetings, we were bemoaning the fact that survey questions are poor travellers, especially across national and cultural boundaries. The BSAS, for instance, despite intentions to the contrary, had managed to transplant only one or two questions directly from

the GSS. The West German ALLBUS contained a few more replications as a result of a specific bilateral agreement with the GSS. But a long-standing problem for all national time-series of this sort was, and is, that the concern for a year-by-year comparability within a country is often conflict with a concern of comparability between countries. Since funding is almost from national sources, the choice both of topics and of question-wording tends to reflect national rather than cross-national priorities.

So the conclusion we reached in 1983 was that the ideal way of securing a greater element of cross-national comparability should probably be via a standardised bolt-on supplementary questionnaire designed specifically for that purpose. With this in mind, SCPR sought and obtained a small grant from the Nuffield Foundation for convening a meeting (and then another) between representatives of the other three national social attitudes surveys which we already had some contact - those in Australia, West Germany, and the USA. There, the idea of a bolt-on, mutually-designed series of supplementary questionnaires could be aired and, perhaps, taken further.

As it turned out, the idea was warmly received by all four groups, who also decided that these supplements should be in a self-completion format, primarily for reasons of cost and to avoid adding to the already long, personal interviews. At the following meeting, the first bolt-on module, on the role of government, was developed and scheduled for fielding in 1985.

It was later translated into American English, Australian English and German to obtain functionally-equivalent rather than identical wordings. Although we were not quite aware of it at the time, the ISSP had effectively started. Since then, several other modules have been designed and fielded, the membership has grown threefold, and the structure has become a bit more bureaucratic, but not (yet) unduly so.

Sample Type:	Panel of respondents from the earlier NSSS 'Family' and 'Lifestyles' surveys, conducted in late 1989 and early 1990 (from which the socio-demographic background variables for the 1993 data are taken). The sample for these two surveys was a nationwide simple random sample covering the whole of Australia, drawn from the (compulsory) Australian federal electoral rolls by the Australian Electoral Commission. Potential respondents were eligible for inclusion in the sample if they had completed the Family or Lifestyle surveys, had not indicated that they did not wish to participate further and were still contactable at the same address. The simple random sampling method means that standard statistical tests are appropriate (i.e., without the downward adjustment of effective sample size appropriate for the clustered sample designs usual in face-to-face interviews).

Study-Title:	Austrian Social Survey 1993
Fieldwork Dates:	February to March 1993
Sample Type:	The ISSP 1991 and ISSP 1992 were fielded together with the Austrian Social Survey 1993. The whole sample is divided into two sub-samples which contain at times the one or other ISSP-questionnaire. The sample is a three stage stratified person random sample. The sample-points are selected according to the criteria of region and size of place. Within the household the interviewer has to select the respondent among the household-members over 16 years of age according to a random method.

Fieldwork Methods:	Face-to-face interview
Context of ISSP questionnaire:	Part of the "Austrian Social Survey 1993"
Sample Size:	984
Language:	German
Weighted:	Yes
Weighting:	Weighting corrects the compound data-set of the "Austrian Social Survey 1993" to the most recent Austrian Microcensus data. The weighted ISSP 1991 dataset gives slightly different marginals from the weighted overall dataset. Due to the fieldwork-method (face-to-face interviews in private households) the economically active population is considerably underrepresented in the sample.

Study Description: Great Britain

Study-Title: British Social Attitudes 1991 Survey

Fieldwork Dates: Almost all interviews carried out between March and June 1991.

Principal Investigator: Roger Jowell, Lindsay Brook, Gillian Prior, Bridget Taylor, SCPR

Sample Type: Stratified random probability. In 1991, experimentally, half of the sample was drawn from the electoral register and half from the Postcode Address File (PAF). It was designed to be representative of adults aged 18+ living in private accommodation in Great Britain

Fieldwork Methods: Self-completion supplement given to respondents following the face-to-face interview (on which the classification questions were asked). The supplement was either collected by the interviewer or posted back to office.

Context of ISSP questionnaire: SCPR's British Social Attitudes 1991 - A-version of self-completion questionnaire

Study-Title: ISSP 1991: Religion - The Hungarian Survey

Fieldwork Dates: April 14 to May 6, 1991

Principal Investigator: Tamas Kolosi, TARKI, Budapest

Sample Type: A two-stage sampling procedure was applied. About one hundred communities were selected, the weighted (with the number of respondents) means and variances of which sufficiently reproduced the distribution of the countries' 3100 communities (weighted by population size) on a long series of variables (e.g. proportion of labour force employed in agriculture, proportion of houses/flats with piped water, ration of different age groups in population, etc.). In each of the selected communities 10-40 individuals randomly selected from the population register were interviewed. For this wave in 1991, 1000 "main" and 500 reserved addresses were used. If the person on the main address could not have been contacted three times, one of the reserved addresses in the same community was used as a substitute.

Fieldwork Methods: Personal Interview

Sample Size: 1000

**Weighting
Procedure:**

Apart from some significant differences in age composition and male/female ratio, the TARKI-E sample also seems to oversample males and females with secondary, and females with tertiary education. If this poses any serious problems, the users can judge themselves, since we added a weighting variable to the file. Application of weighted instead of unweighted data does not lead to statistically significant change in the mean of any of the ordinal or continuous variables in the file. Users are suggested to use the weight only to check the results obtained with unweighted data.

Study-Title: New Zealanders' Attitudes to Religion - ISSP: 1991 Survey

Fieldwork Dates: June and July 1991

Principal Investigator: P. Gendall, Massey University, Palmerston North, New Zealand

Sample Type: The sample was selected using the 1990 New Zealand electoral rolls which contain the names of all registered voters over the age of 18 years. New Zealand is divided into 97 electorates of approximately equal size. A systematic random sample was taken from each electorate. There were no age or sex quotas, because the electoral rolls were used, the sample reflects the distribution of the population.

Study Description: Philippines

Study-Title: 1991 ISSP Religion

Fieldwork Dates: June 7 to July 15, 1991

Principal Investigator: Social Weather Stations, Inc. (SWS)

Sample Type: Multi-stage probability sample. The survey had 1200 adult respondents (18 years and above or the voting population), with sampling quotas of 300 for each of the four major areas: Metro Manila, Balance Luzon (areas within Luzon but outside Metro Manila), Visayas and Mindanao. Respondents of the latter three major areas were further subdivided into 150 urban and 150 rural respondents. The number of respondents is always realized. The survey has two types of respondents: the household head, who answered all questions pertaining to the household, and the adult respondent, not necessarily the household head, who answered the rest of the questions. The ISSP questions were answered by the adult respondent.

Fieldwork Institute: Social Weather Stations, Inc. (SWS)

Fieldwork Methods: Face-to-face interview.

Context of ISSP questionnaire: Part of a national study

Sample Size: 1063 achieved

Sampling Methodology (see below)

Weighted: Yes

Weighting Procedure: To come up with total Philippine figures, appropriate weights, based on the National Statistics Office's (NSO) 1980 projections for the year 1985, were applied. The use of these weights made the ISSP religion module results comparable with regular SWS surveys. The obtained weights are given below.

The allocation of sample units in each stage is as follows:

Study Description: Poland

Study-Title: ISSP 1991: Religion (Poglady Polakow 1991)

Fieldwork Dates: November 15 to December 15, 1991

Principal Investigator: Bogdan Cichomski, Institute for Social Studies, University of Warsaw

Sample Type: National multi-stage random sample. The sample was a three stage national random sample. The first stage consisted in selection of primary sampling units (all cities having more than 100,000 inhabitants, a random sample of cities having less than 100,000 inhabitants divided into 5 strata according to the number of inhabitants and a random sample of rural areas divided into 8 strata by geographic region). In the second stage a number of households (non-institutional) was drawn separately from each primary sampling unit using registers of the Central Statistical Office. The number of selected households was proportional to the general number of households in each strata. In the third stage one person aged 15-65 was drawn in each household by an interviewer using random numbers.

Fieldwork Institute: Research Department of Polish Academy of Sciences.

Fieldwork Methods: The background data were collected through personal interviewing, the ISSP Religion Module was conducted as a self-administered separate questionnaire, filled in by respondent him/herself after completing the interview and then returned to the interviewer.

Context of ISSP questionnaire: National study of work values conducted in cooperation with Cornell University under the international research project.

Principal Investigator:	Niko Tos, Janez Stebe; Public Opinion and Mass Communication Research Centre, University of Ljubljana
Sample Type:	The sampling method is a systematic multi-stage sampling of adults aged 18 to 70 years. It is an EPSEM sample of persons. Based on a central register of citizens at first stage equally distant points (persons) are selected. At second stage two more points were drawn by steps to the left and to the right from the first point. Finally clusters of five persons are formed, again systematically, around points on register from the previous stage.

Explanations

<1> A variable (and reference) number have been assigned to each item in the study. In the present codebook which documents the archived data set, these numbers are identical. Should the data set be subsetted or rearranged the variable numbers might change to reflect the order of the new data set while the reference numbers would remain unchanged to provide a link to the archived data set.

<2> Indicates the abbreviated (24 character maximum) variable label used within OSIRIS or SPSS system files.

<3> "Location" indicates the starting position of the variable when the dataset is stored in the OSIRIS format. "Width" describes the number of positions of the variable.

<4> "MD" indicates the designation of the missing data. MD1 indicates an explicit defined single value. MD2 designates a single value or a value range, i.e. all values equal or greater than this value have been declared missing. Although these categories are defined as missing data categories, this does not mean that the user should not or cannot use these codes if so desired.

<5> If a variable contains implied decimals, the message "Dec.places: xx" appears here, where xx is the number of decimal places.

<6> Indicates the full question text taken from the British questionnaire. Wherever possible the original sequence of questions has been retained, although some changes were necessary to integrate the different national questionnaires.

<7> Indicates commentaries and explanations added during the processing of the study. <within question or answer texts may indicate whether the questionnaire in a particular country is deviating from the general format.

<8> Indicates the code value for the single answer category.

<9> Indicates the textual definition of the codes. Abbreviations commonly used are DK (don't know), NA (no answer), Can't choose, Not applicable and Not available.

<10> Indicates percentaged frequencies by country. This form is used whenever code categories have the same meaning for all countries. Column percentages are based only on "valid cases". Missing data values were excluded from percentages.

Standard occupation classification unit groups within minor groups.

Source: In 1991 OPCS introduced a new occupation coding schema, the Standard Occupational Classification (SOC). "Occupations are viewed in SOC as coherent sets of work activities carried on by individuals. In defining occupational groups, the aim has been to distinguish as far as possible in terms of the type and level of skills required to carry out the main work activities" (OPCS, 1991b, p.2).

Note 0004

This Note refers to V122 and contains specific explanations about the size and type of the place of residence.

West Germany

The political size of community (V122) contains classified details of size about places of residence for each of the respondents. Unclassified data are not available for reasons of data protection.

The starting point for these details of size is the size of the communities as political administrative units.

Political administrative units often describe incompletely the type of community where the respondent lives. To adjust the regional statistic to the requirements of a spatially relevant and ecologically based structural analysis, the variable 'Boustedt - classification of the size of communities' (V122) was integrated in addition to the size of the political administrative units. The real type of settlement in the surrounding place of residence is decisive for the classification, independent of the political administrative units.

NORC size of place

Source: GSS Methodological Report No.4.

Within an SMSA and --

- 01 A large central city (over 250.000)
- 02 A medium size central city (50.000 to 250.000)
- 03 A suburb of a large central city (a)
- 04 A suburb of a medium size central city
- 05 An unincorporated area of a large central city
(division, township, etc.)
- 06 An unincorporated area of a medium central city

Not within an SMSA, (within a country) and --

- 07 A small city (10.000 to 49.999) (b)
- 08 A town or village (2.500 to 9.999)
- 09 An incorporated area less than 2.500 or an
unincorporated area of 1.000 to 2.499 (c)
- 10 Open country within larger civil divisions, e.g.
township, division

Remarks:

- (a) A suburb is defined as any incorporated area or unincorporated area of 1.000+ (or listed as such in the U.S. Census PC (1)-A books) within the boundaries of an SMSA but not within the limits of a central city of the SMSA. Some SMSAs have more than one central city, e.g., Minneapolis-St. Paul. In these cases, both cities are coded as central cities.
- (b) If such an instance were to arise, a city of 50.000 or over which is not part of an SMSA would be coded '07'.
- (c) Unincorporated areas of over 2.499 are treated as incorporated areas of the same size. Unincorporated areas under 1.000 are not listed by the Census and are treated here as part of the next larger civil division, usually the township.
