### Acknowledgement of Assistance

All manuscripts utilizing data made available through the ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG should acknowledge that fact as well as identify the original collectors of the data.

We kindly ask all users to follow some adaptation of the following statement:

The data utilized in this (publication) were documented and made available by the ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG, Koeln. The data for the 'ISSP' were collected by independent institutions in each country (e.g. the Australian survey was conducted by the RISS at the Australian National University (J. Kelley, M. Evans, C. Bean)). Neither the original collectors nor the ZENTRALARCHIV bear any responsibility for the analyses or interpretation presented here.

In order to provide funding agencies with essential information about the use of archival resources, and to facilitate the exchange of information about research activities based on the ZENTRALARCHIV's holdings, each user is expected to send two copies of each completed manuscript to the ZENTRALARCHIV.

### An introduction to the ISSP

The International Social Survey Programme (ISSP) is a voluntary grouping of study teams in eleven nations (soon to become thirteen or fourteen), each of which undertakes to run a short, annual self-completion survey containing an agreed set of questions asked of a probability-based, nation-wide sample adults. The topics change from year to year by agreement, with a view to replication every five years or so.

The questions themselves are developed by subgroups and then thrashed out at an annual meeting attended by representatives of each national team. At the last meeting in May 1989, in London, there were 29 participants from the 11 national teams, including representatives of the ISSP's 'official' data archive, the Zentralarchiv at the University of Cologne.

A constitution of sorts has now been adopted by members of the ISSP. It contains, for instance, rules of entry for new members and responsibilities of membership. The primary duty of each member is, of course, to run every annual module (or at least nearly every one) in the agreed format. But there are no central funds for the ISSP: each national team covers the costs of its own piloting, fieldwork, data preparation, travel to meetings and so on. Since the ISSP has agreed to use one language for drafting and for meetings - (British) English - there are no central translation costs.

Improbable as it may seem, this general formula has worked well so far. The annual questionnaires for instance (contrary to all advice and experience) have actually been designed for the most part in committee, and though inevitably flawed, are no less successful than most. Admittedly, this success owes a lot to careful prior development work by drafting groups and to subsequent adjustments after piloting. In any event, fascinating data are already beginning to emerge.

A fuller treatment than is given here, of the results generated so far by the series, is to be provided in the first ISSP Report, a book funded by the European Cultural Foundation and due to be published by the Netherlands Social and Cultural Planning Bureau (SCP) in 1990.

As may by now be apparent, the ISSP has grown and developed somewhat haphazardly, and this pattern shows every sign of continuing as long as it seems to work. The ISSP certainly came into without much serious planning, having emerged as a vague idea during an impromptu meeting the two of us in 1983 whose purpose was primarily to exchange experiences and explore opportunities for borrowing each other's questions.

At that stage, the British Social Attitudes Survey (BSAS) was still in its first year, but had just received news that it was to be given at least a four-year life span through the generosity of the Sainsbury Family Charitable Trusts. The US General Social Survey (GSS), in contrast, was some 12 years old and had already acted as something of a role-model for

other national series, including the BSAS itself, the West German Allgemeine Bevoelkerungsumfrage der Sozialwissenschaften (ALLBUS) (started in 1980) and the Australian National Social Science Survey (NSSS) (which was about to take its first fieldwork round).

As is usual at such meetings, we were bemoaning the fact that survey questions are poor travellers, especially across national and cultural boundaries. The BSAS, for instance, despite intentions to the contrary, had managed to transplant only one or two questions directly from the GSS. The West German ALLBUS contained a few more replications as a result of a specific bilateral agreement with the GSS. But a long-standing problem for all national time-series of this sort was, and is, that the concern for a year-by-year comparability within a country is often conflict with a concern of comparability between countries. Since funding is almost from national sources, the choice both of topics and of question-wording tends to reflect national rather than cross-national priorities.

So the conclusion we reached in 1983 was that the ideal way of securing a greater element of cross-national comparability should probably be via a standardised bolt-on supplementary questionnaire designed specifically for that purpose. With this in mind, SCPR sought and obtained a small grant from the Nuffield Foundation for convening a meeting (and then another) between representatives of the other three national social attitudes surveys which we already had some contact - those in Australia, West Germany, and the USA. There, the idea of a bolt-on, mutually-designed series of supplementary questionnaires could be aired and, perhaps, taken further.

As it turned out, the idea was warmly received by all four groups, who also decided that these supplements should be in a self-completion format, primarily for reasons of cost and to avoid adding to the already long, personal interviews. At the following meeting, the first bolt-on module, on the role of government, was developed and scheduled for fielding in 1985. It was later translated into American English, Australian English and German to obtain functionally-equivalent rather than identical wordings.

Although we were not quite aware of it at the time, the ISSP had effectively started. Since then, several other modules have been designed and fielded, the membership has grown threefold, and the structure has become a bit more bureaucratic, but not (yet) unduly so.

## **The ISSP 1989 module on work orientation and leisure**

Already at the first ISSP conference in 1984 it was decided that the topic "work orientation and leisure" would be one of the main modules that should be examined by International research project ISSP. In 1987 the group came to the agreement that the module should be fielded in 1989. At the same time the topic was discussed in more detail and the content was shaped more precisely. The drafting group, consisting of ZUMA as convener, The SCPR (Great Britain), and SCP (Netherlands) was given a structured list of the topics that should be included and was asked to work out a draft questionnaire by the end of 1987.

The work orientation module should in equal shares cover the following three major topics:

### **1. General attitudes to work and leisure**

- work vs. leisure,
- the work ethic and commitment to work,
- the role of work in creating feelings of personal worth,
- the alienation effects of not having work, etc.

### **2. Work organisation**

attitudes to

- self-employment,
- public vs. private sector work,
- large vs. small workplaces,
- manufacturing vs. service sector,
- job-sharing or job-splitting,
- full-time and part-time,
- profit-sharing,
- attitudes towards getting ahead,

### **3.A Work content**

- work that was done,
- characteristics or qualities of work,
- work organization questions relating to specific job done by respondent

### **3.B Collective interests**

- Unions, employers, managers etc.
- collective interests organized around the work

### **3.C Second job**

- activities, extent, special demographics and reasons why a second job is held

Points 1 and 2 should be based on items which all sample members and not only those respondents currently working could answer.

After having consulted further scholars working in the wide field of work and leisure who were asked for assistance and additional comments on the questionnaire proposal the drafting group sent the questionnaire to all ISSP members. Their comments were also considered and integrated in the questionnaire so that the "fine-tunde" version of the 1989 module was ready to be pretested in July 1988.

## Study description

To differentiate countries in the crosstabulations within this codebook we have decided to use the International automobile identification codes:

AUS - Australia  
D - West Germany  
GB - Great Britain  
USA - United States of America  
A - Austria  
H - Hungary  
NL - Netherlands  
I - Italy  
IRL - Ireland  
NIRL - Northern Ireland  
N - Norway  
IL - Israel

### West Germany - D

#### Sample size

Issued 3.360  
Achieved 1.575

#### Sample type

The sample type was a three-stage stratified random sample. The first stage consisted in the selection of sample-points, the second in the selection of households by the random-route method. At the third stage the interviewer had to select a person from the household with German nationality who was at least 18 years of age. The sample is representative for adult Germans, living in the Bundesrepublik or West-Berlin in private households during the fieldwork time.

The ISSP supplement was not to be asked to fill in by all respondents of the Sozialwissenschaft-Bus sample, but only by eighty per cent of the original sample. Therefore, the sample points ending with 0 or 5 were filtered out. All in all n = 1597 interviews of the Sozialwissenschaften-Bus III/1989 had been realised in sample points, which were not 0 or 5. From this sample, n = 1464 written ISSP-interviews could be realised. This is 91.7 per cent of the sample.

All n = 133 cases of non-respondents are refusals. By mistake in the organisation of dispatch, the ISSP questionnaires have been sent to some sample points, which were - because of the considered reduction of sample size - not to fill in the supplement. This especially is current for the second and third dispatch. Therefore, another n = 130 interviews were realised. Agreeing with the Zentrum fuer Umfragen, Methoden und Analysen (ZUMA) these cases were integrated in the data processing, so that the full sample size of the ISSP is n = 1594. After data cleaning process 19 interviews were eliminated so that the sample size of the ISSP is n = 1575. By variable V137 'Sample point', the 130 130 additionally interviewed can be filtered out.

### **Fieldwork**

In cooperation with the Zentrum fuer Umfragen, Methoden und Analysen (ZUMA), the Gesellschaft fuer Marketing-, Kommunikations- und Sozialforschung (GFM-GETAS) assumed the technical organisation and the realization of the study.

The ISSP 1988 was realized as a drop-off of the Sozialwissenschaften-Bus III/89. The method used was a self-completing supplement to the Sozialwissenschaften-Bus interview. The respondents were asked to fill in the self-completing questionnaire, the interviewers were asked to motivate the respondents to fill in the self-completing questionnaire immediately so that the interviewers were able to collect the supplement themselves. 90 per cent of the supplements were collected by the interviewer, 10 per cent were completed collected later. Exceptionally, supplements were sent postally to the institute by the respondent.

### Great Britain - GB

In 1989, as in 1987 and 1986, the generosity of the Sainsbury Family Charitable Trusts allowed us to interview around 3.000 respondents, a substantial increase from the 1.700 to 1.800 interviewed in the first three years of the British Social Attitudes survey series. So we were again able to cover more topics in the questionnaire. Core questions were asked of all respondents, and the remaining questions were asked of a half sample of around 1.500 respondents each - version A of one half, version B on the other. The structure of the questionnaire is shown in Appendix III.

#### **The Sample**

The survey was designed to yield a representative sample of adults aged 18 or over living in private households in Britain.

For practical reasons, the sample was confined to those living in private households whose addresses were listed in the electoral registers. People living in institutions (though not in private households at such institutions) were excluded, as were households whose addresses were not on the electoral registers. Fieldwork was timed to start in mid-March, so the sample was drawn from the 1988 registers, which were just reaching the end of their period of currency.

The sampling method involved a multi-stage design, with four separate stages of selection:

- I. Selection of parliamentary constituencies  
The stratification factors used in this survey were:
  1. Registrar General's Standard Region,
  2. Population density (persons per hectare): over 10, 5 - 10, under 5
  3. A ranking by percentage of homes that were owner-occupied
- II. Selection of polling districts
- III. Selection of addresses
- IV. Selection of individuals.

## **Fieldwork**

Interviewing was carried out mainly during March, April and May 1989, with only six per cent of interviews taking place later.

As an experiment to test the effect of response rates, a letter was sent to a random half of the selected households shortly before fieldwork began. This briefly described the purpose of the survey and the coverage of the questionnaire, and asked for cooperation when the interviewer called. In the event, the effect of the advance letter on overall response was negligible.

Fieldwork was conducted by 164 interviewers drawn from SCPR's regular panel, all of whom attended a one-day briefing conference to familiarise them with the selection procedures and questionnaires. The average interview length, for both versions of the questionnaire, was 63 minutes.

## **The questionnaire**

As in earlier rounds of the series, respondents were asked to fill in a self-completion questionnaire which was, whenever possible, collected by the interviewer. Otherwise the respondent was asked to post it to SCPR. If necessary, up to three postal reminders were sent to obtain the self-completion questionnaire.

There were two versions of the self-completion supplement, reflecting the different topics covered in the main questionnaire. The 1988 International Social Survey Programme (ISSP) module, containing women and the family, is in Version A, and the 1989 ISSP module is in Version B.

### Response rates

Four hundred and one respondents (14 per cent of those interviewed) did not return their self-completion questionnaire. Version A of the self-completion questionnaire was returned by 87 per cent of respondents, and version B by 86 per cent. Non-respondents to the self-completion questionnaire included a higher proportion of unskilled manual workers, residents of Greater London and respondents with no formal educational qualifications. Labour identifiers were less likely than Conservative or 'centre' party identifiers to return a self-completion questionnaire, while 24-44 year olds were more likely than other groups to do so.

However, since the overall proportion returning a self-completion questionnaire was high, we decided against additional weighting to correct non-response.

Those not returning a self-completion questionnaire will have blank records on the following cards:

A Version: Cards 18, 20, 21, 22, 23

B Version: Cards 19, 20, 21, 22, 23

### Weighting

Before analysis, the data were weighted to take account of differences between the number of people listed in the register (which determined the original selection probability) and the number found at the address. Such differences were found in about 27 per cent of addresses, in each of which the data were weighted by the number of persons aged 18 or over currently living at the address, divided by the number of electors listed on the register for that address. Percentages for the core questions are based on the total sample (2930 weighted), while those for questions in version A or B are based on the appropriate sub-samples (1469 and 1461 weighted, for the interview questionnaire and 1274 and 1255 weighted, for the self-completion questionnaire). Since both the percentage distributions and the numerical frequency counts are based on weighted data, figures will not necessarily add up to 100 per cent.

## Northern Ireland

In 1989, the Nuffield Foundation and the Northern Ireland Office agreed to fund three extensions of the British Social Attitudes survey to Northern Ireland. Core questions were asked in both surveys, but in addition there was a special module on community relations in the Northern Ireland questionnaire (Qs. 77-97 and Qs. 915-915). Some of these questions were asked in Britain too, so allowing us to compare the attitudes of those living in Northern Ireland with the attitudes of people in Britain. The structure of the Northern Ireland questionnaire, and its relationship to the British questionnaire, is shown in Appendix III. An advisory board consisting of representatives from Social and Community Planning Research, the Policy Planning and Research Unit (PPRU) at Stormont (which also carried out the sampling and the fieldwork), the Policy Research Institute in Belfast (which had the responsibility for special analyses), the academic community and the Community Relations Council met several times in the month before fieldwork to plan the survey and design the module on community relations. As with all questionnaire modules, however, final responsibility for its coverage and wording remains with SCPR.

### **Sample design**

The survey was designed to yield a representative sample of all adults aged 18 or over living in Northern Ireland.

The sample was drawn from the rating list, the most up-to-date listing of private households, and made available to PPRU for research purposes. People living in institutions (though not in private households in such institutions) were excluded. The rating list file was first stratified according to region, with addresses in Belfast, East Northern Ireland and West Northern Ireland appearing sequentially on the file.

Because of the small geographical size of Northern Ireland, it was not necessary to cluster addresses within areas. The sample was therefore a simple random sample of all households listed on the rating list. Selection of addresses was made by taking a random starting point and then, treating the list of addresses as circular, selecting every  $n$ th address until the desired number of households had been sampled. The issued sample was 1.398 households.

The rating list provides a good sampling frame of addresses, but contains no information about the number of people living at an address. So a further selection stage was required to convert the listing of addresses to a listing of individuals.

### **Fieldwork**

Interviewing was carried out mainly during March and April 1989; only six interviews took place later. Fieldwork was conducted by 62 interviewers drawn from PPRU's panel. All interviewers attended a one-day briefing conference to familiarise them with the selection procedures and questionnaires. The interview took on average 75 minutes to administer.

### **The questionnaire**

As in the British Social Attitudes survey, respondents were asked to fill in a self-completion questionnaire which was, whenever possible, collected by the interviewer. Otherwise the respondent was asked to post it directly to a Northern Ireland Post Office box from which it was forwarded to SCPR. If necessary, up to two postal reminders were sent to obtain the self-completion questionnaire from those who had not returned it.

**Response rates**

	No.	%
Addresses issued	1398

Interview not achieved	438	34
- refused	264	20
- non-contact	103	8
- other non-response	71	5
Self-completion questionnaire collected/sent to office	780	60

A response rate of 65 per cent was achieved in Belfast; it was 70 per cent in East Northern Ireland and 71 per cent in West Northern Ireland.

In all, 780 respondents returned the self-completion questionnaire, 90 per cent of those interviewed.

**Weighting**

In Northern Ireland, addresses could not be selected with probability proportionate to the size of the household (as with the electoral register sampling used in British Social Attitudes). So before the analysis, the data were weighted to adjust for the fact that individuals living in large households of being included in the sample. This means that the weights applied to the Northern Ireland sample are, in general, larger than those applied to the British one. All the weights fell within a range between one and seven. The distribution of weights used is shown below.

#### **Sample Design**

The Primary Sampling Units (PSUs) employed are Standard Metropolitan Statistical Areas (SMSAs) or non-metropolitan counties selected in NORC's Master Sample. These SMSAs and counties were stratified by region, age, and race for selection. The units of selection of the second stage were Block Groups (BGs) and Enumeration Districts (EDs). These EDs and BGs were stratified according to race and income before selection. The third stage of selection was that of blocks. The blocks were selected with probabilities proportional to size. In places without block statistics, measures of size for the blocks were obtained by field counting.

### **A Comparison of the 1988 Current Population Survey to the 1987-1989 General Social Surveys**

In accordance with the documentation standards of the International Social Survey Program (ISSP), we compare in Table 1 the distributions for age, gender, years of schooling, and labour force participation from 1987-1989 General Social Surveys (GSSs) with latest available Census estimates from the 1988 Current Population Survey (CPS).

First, the weighted GSS distributions generally match the CPS figures better than the unweighted figures (Table 2). This is clearly the case on age, gender, and years of schooling, but not for labour force participation.

Second, the weighted GSS-CPS matches are generally quite good. Age distributions correspond closely across all age groups. Women are overrepresented on the GSS. This is common to virtually all full probability, random respondent surveys. (The CPS uses household informants rather than random respondents). Third, the GSS overrepresents the college educated and underrepresents the less educated. It appears that much of this difference results from differences between the CPS and the GSS in how the item on education is asked and coded. Finally, the GSS underrepresents those not currently employed. At least some of this difference comes from the 16 and 17 year olds included in the CPS figures. Very few are currently employed and their inclusion lowers the total percent employed.

**Hungary - H****The Sample**

The original sample consisted of 1000 persons. They were selected by cluster sampling. The first step was to select the communities and to determine the number of persons to be asked in each settlement. This first step was made in a way so as to obtain a sample which displays the same means and standard deviations on a number of variables concerning the social, demographic, economic, and geographic characteristics of the community as the Hungarian adult population. Data about the characteristics of the communities were taken from the 1980 census.

At second step random samples were taken from the adult population of each selected community. The list of persons (and their addresses) were provided by the Population Register Bureau.

The proportion of the drop-outs was 26.1 % of the original sample.

**Response rate:**

Failure of the interview is due to the fact that:	Total sample %	Drop-outs %
1. Respondent was unable to answer (because of illness or having been drunk)	2.2	8.4
2. Respondent rejected being interviewed	5.4	20.7
3. Respondent did not live at home temporarily	5.3	20.4
4. Respondent moved to a new flat or house (new address unknown)	5.7	21.7
5. Address was wrong	1.8	6.9
6. Respondent died	2.1	8.2
7. Somebody else from the family of the respondent already was asked)	0.3	1.3
8. Other reasons	3.3	12.5
<b>Total</b>	<b>26.1</b>	<b>100.1</b>

In most cases, 'other reasons' (8) means that the respondent could not be found at home.

**Language:** Hungarian

**Proportion of failure's reasons by sex:**

Failure of the interview is due to the fact that:	Males %	Females %
1. Respondent was unable to answer (because of illness or having been drunk)	2.5	2.0
2. Respondent rejected being interviewed	5.5	5.3
3. Respondent did not live at home temporarily	6.8	4.2
4. Respondent moved to a new flat or house (new address unknown)	6.2	5.3
5. Address was wrong	1.8	1.8

7. Somebody else from the family of the respondent already was asked)	0.2	0.4
8. Other reasons	4.3	2.4
<b>Total</b>	<b>29.7</b>	<b>23.2</b>

As the tables shows, somehow greater proportion of drop-outs among males can be explained mainly by such reasons as number 3 and 8.

**Proportion of failure's reasons amongst males and females belonging to different cohorts**

As the table shows, the members of the older generations are more likely to refuse answers or being unable to answer than younger respondents, but young males are very often far from home (because of being in the army, etc.).

**Netherlands - NL****Sample size:**

The sample of the original survey was 2008 cases, the non-reponse was about 28%. Out of these 2.008 respondents, 1690 sent back the questionnaires, which makes for a response of about 84%.

In the Labour Force Studies a two stage sampling procedure is applied. Municipalities which are the primary sampling units (psu's) are divided into strata according to location, industrial structure and population size. Cities of more than 30.000 inhabitants form separate strata. One psu is selected from each stratum.

For each of the municipalities selected at the first stage a register of addresses (households) is established. A sample of households is then randomly selected from each of the municipalities' registers. The overall sampling probability is equal for all households.

The ISSP sample is a random sample of persons in the Labour Force Studies.

The sample was selected from persons who had participated in the Labour Force Studies in January, February and March 1989. Most of the background variables are collected from the Labour Force Study data-set.

Labour Force data were collected by telephone or personal interview.

ISSP data were collected by postal self-completion questionnaire. The last follow-up, where 30.1% of the interviews were achieved, was conducted by telephone or personal interviews.

## Explanations

- <1> A variable (and reference) number have been assigned to each item in the study. In the present codebook which documents the archived data set, these numbers are identical. Should the data set be subsetted or rearranged the variable numbers might change to reflect the order of the new data set while the reference numbers would remain unchanged to provide a link to the archived data set.
- <2> Indicates the abbreviated (24 character maximum) variable label used within OSIRIS or SPSS system files.
- <3> "Location" indicates the starting position of the variable when the dataset is stored in the OSIRIS format. "Width" describes the number of positions of the variable.
- <4> "MD" indicates the designation of the missing data. MD1 indicates an explicit defined single value. MD2 designates a single value or a value range, i.e. all values equal or greater than this value have been declared missing. Although these categories are defined as missing data categories, this does not mean that the user should not or cannot use these codes if so desired.
- <5> If a variable contains implied decimals, the message "Dec.places: xx" appears here, where xx is the number of decimal places.
- <6> Indicates the full question text taken from the British questionnaire. Wherever possible the original sequence of questions has been retained, although some changes were necessary to integrate the different national questionnaires.
- <7> Indicates commentaries and explanations added during the processing of the study. < > within question or answer texts may indicate whether the questionnaire in a particular country is deviating from the general format.
- <8> Indicates the code value for the single answer category.
- <9> Indicates the textual definition of the codes. Abbreviations commonly used are DK (don't know), NA (no answer), Can't choose, Not applicable and Not available.
- <10> Indicates percentaged frequencies by country. This form is used whenever code categories have the same meaning for all countries. Column percentages are based only on "valid cases". Missing data values were excluded from percentages.

Note 0004

This Note refers to V125/ V126 and contains specific explanations about the size and type of the place of residence.

### West Germany

The political size of community (V126) contains classified details of size about the places of residence for each of the respondent. Unclassified data are not available according to the principle of data protection. Starting-point for these details of size is the size of the communities as political administrative units.

Political administrative units often describe only incompletely the type of community where the respondent lives, for example in case of a political independent (autonomous) small marginal community on the outskirts bordering local directly on a large city and integrated socio-economically in this city. To adjust the regional statistic to the requirements of a spatial relevant and ecological based structural analysis the variable 'Boustedt - classification of the size of communities' (V125) additional to the size of the political administrative units was integrated. Independent of the political administrative units the real type of settlement in the surrounding place of residence is decisive for the classification.

## NORC size of place

Source: GSS Methodological Report No.4.

## Within an SMSA and --

- 01 A large central city (over 250.000)
- 02 A medium size central city (50.000 to 250.000)
- 03 A suburb of a large central city (a)
- 04 A suburb of a medium size central city
- 05 An unincorporated area of a large central city  
(division, township, etc.)
- 06 An unincorporated area of a medium central city

## Not within an SMSA, (within a country) and --

- 07 A small city (10.000 to 49.999) (b)
- 08 A town or village (2.500 to 9.999)
- 09 An incorporated area less than 2.500 or an  
unincorporated area of 1.000 to 2.499 (c)
- 10 Open country within larger civil divisions, e.g.  
township, division

## Remarks:

- (a) A suburb is defined as any incorporated area or unincorporated aarea of 1.000+ (or listed as such in the U.S. Census PC (1)-A books) within the boundaries of an SMSA but not within the limits of a central city of the SMSA. Some SMSAs have more than one central city, e.g., Minneapolis-St. Paul. In these cases, both cities are coded as central cities.
- (b) If such an instance were to arise, a city of 50.000 or over which is not part of an SMSA would be coded '07'.
- (c) Unincorporated areas of over 2.499 are treated as incorporated areas of the same size. Unincorporated areas under 1.000 are not listed by the Census and are treated here as part of the next larger civil division, usually the township.
