

EUROBAROMETER 2003.3

PUBLIC OPINION IN THE CANDIDATE COUNTRIES

Fieldwork: June-July 2003

Publication: September 2003

Information and Communication Technology

Candidate Countries Eurobarometer 2003.3 - Magyar Gallup Intézet

This survey was requested by the European Union Directorate General **Employment and Social Affairs** and coordinated by the Directorate General **Press and Communication**

This document does not represent the point of view of the European Commission.
The interpretations and opinions contained in it are solely those of the authors.

Introduction

The Candidate Countries Eurobarometer (CC-EB), gathers information from the societies that are to become members of the European Union in a way that is fully comparable with the Standard Eurobarometer. The CC-EB continuously tracks support for EU membership in each country, and records attitudes related to European issues.

This report covers the results of the wave of survey conducted in June and July 2003, in the 13 candidate countries: Bulgaria, Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Romania, Slovakia, Slovenia and Turkey.

An identical set of questions was asked of representative samples of the population aged 15 years and older in each candidate country. The sample size in Candidate Countries Eurobarometer surveys is at least 1000 people per country, except for Cyprus and Malta, in which the sample size is 500 respondents each. The achieved sample sizes of the 2003.3 wave are:

Bulgaria	1000	Latvia	1004	Slovakia	1061
Cyprus	500	Lithuania	1004	Slovenia	1000
Czech Rep	1000	Malta	500	Turkey	1000
Estonia	1007	Poland	1000		
Hungary	1003	Romania	1047	Total	12126

The survey is carried out by national institutes associated with and coordinated by The Gallup Organization, Hungary, in each of the 13 candidate countries. This network of institutes was selected by tender. All institutes are members of the "European Society for Opinion and Marketing Research" (ESOMAR) or comply with its standards.

The figures shown in this report are weighted by sex, age, region, community size, education level and marital status. The figures given for the candidate region (CC-13) as a whole and for the 2004 Member States (MS 2004) are weighted on the basis of the adult population in each country.

Due to the rounding of figures in certain cases, the total percentage in a table does not always add exactly to 100%, but to a number very close to it (e.g., 99% or 101%). When questions allow for several responses, percentages often add to more than 100%. Percentages shown in the graphics may display a difference of one percentage point in comparison to the tables because of the way previously rounded percentages are added.

Types of surveys in the Eurobarometer series

The European Commission (Directorate-General Press and Communication) organizes general public opinion, specific target group, as well as qualitative (group discussion, in-depth interview) surveys in all member states and, occasionally, in third countries. There are four different types of polls available:

- Traditional standard Eurobarometer surveys with reports published twice a year
- Telephone Flash EB, also used for special target group surveys (e.g., Top Decision Makers)
- Qualitative research ("focus groups"; in-depth interviews)
- Candidate Countries Eurobarometer

The face-to-face general public standard Eurobarometer surveys and the EB Applicant Countries surveys, the telephone Flash EB polls and qualitative research serve primarily to carry out surveys for the different Directorates General and comparable special services of the Commission on their behalf and on their account.

Information and technology

Our report presents a descriptive summary of 10 questions that were asked on the 2003 Summer Candidate countries Eurobarometer (CCEB 2003.3). We will discuss the level of usage of ITC tools and devices in the countries that apply for EU membership in comparison with the current member states. We will take a look why people do not use the Internet if they do not, and how Internet changes the life of those who use it. We will briefly describe the form and level of computer training citizens in the candidate countries received as well as their intention and experiences regarding telework.

In this first chapter, usage of different information and communication technology devices is shown. Results given include usage of Internet, reasons for not using the Internet, and how the Internet is connected to daily life.

1. Usage of devices

Taking a look at the results in detail, we can see that TV is the most widespread device among respondents. Ninety-eight percent of respondents in the 2004 member countries use TV. Television is followed by mobile phones, with a large majority of respondents (70%) in EU-15 countries indicating that they use mobile phones. The CC-13 countries use mobile phones in lower proportions (51%). It is interesting to see that Internet usage is in fifth place -- the EU-15 countries are most likely to use it (44%), followed by 2004 members (31%) and CC-13 countries (23%). Digital TV and Personal Digital Assistants are the devices that the lowest proportions of respondents use (see ANNEX TABLE 1.1). There are only 3% in both parts of Europe who say they do not use any of the listed technologies.

Regarding the country-by-country results in detail, it is apparent that the Maltese are in first place in terms of **TV use**, with 100% of the respondents indicating that they use it. Cypriots,

Hungarians and Slovaks are in second place, with 99%, and Romania is in last place, but the proportion of TV use is also high there: 9 of every 10 Romanian respondents use TV

Mobile phone usage is the highest in Slovenia (77%), followed by the Czech Republic (74%). Romania is in last place, with a much lower proportion of respondents (29%) using mobile phones.

Computer usage is highest in the EU-15 countries (52%), while in the 2004 member countries it is 41%. As for the results by country, Slovenians are in second place (after the EU-15) in this respect, with 51% of respondents indicating computer use. Bulgaria (25%), Turkey (21%) and Romania (20%) are the countries where this proportion is the lowest.

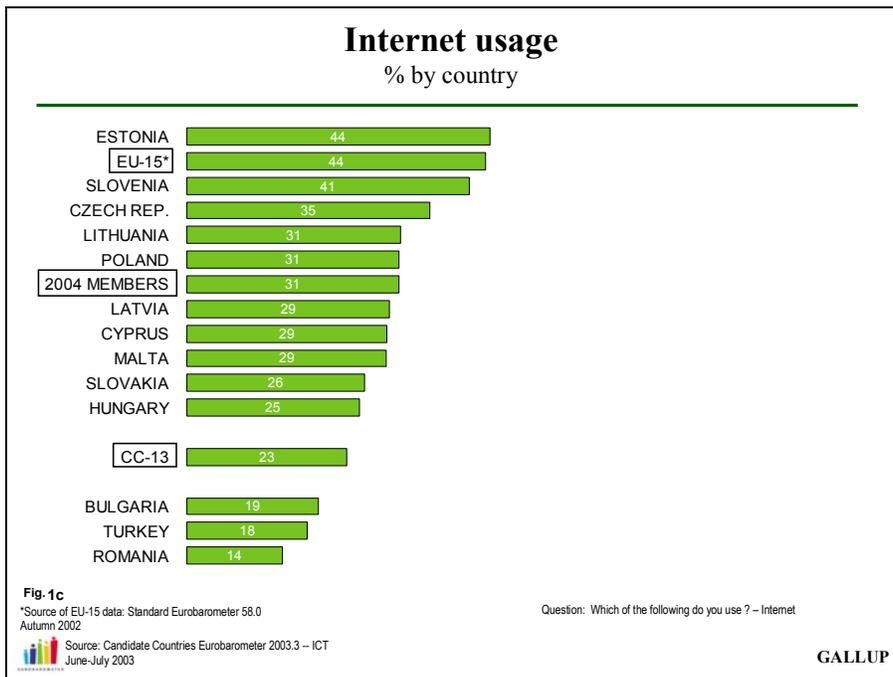

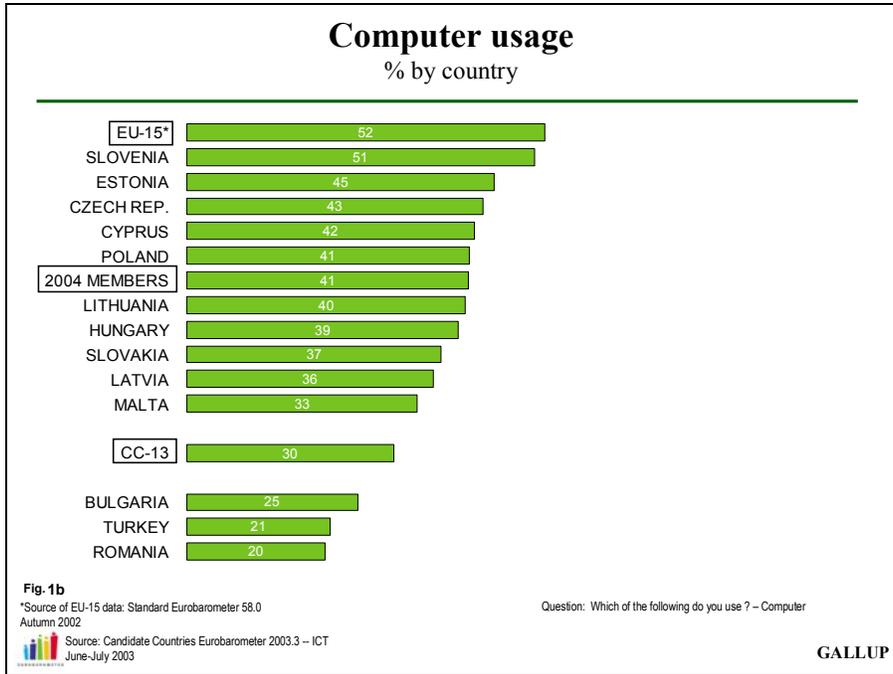

Regarding **Internet** usage, Estonians have the highest percentage of usage, 44% (the same percentage found in the EU-15 countries), followed by Slovenia (41%). Thirty-one percent of respondents from the 2004 member countries and 23% of those from the CC-13 countries use the Internet. The lowest percentages of usage are in the same countries with the lowest computer usage: Bulgaria (19%), Turkey (18%) and Romania (14%).

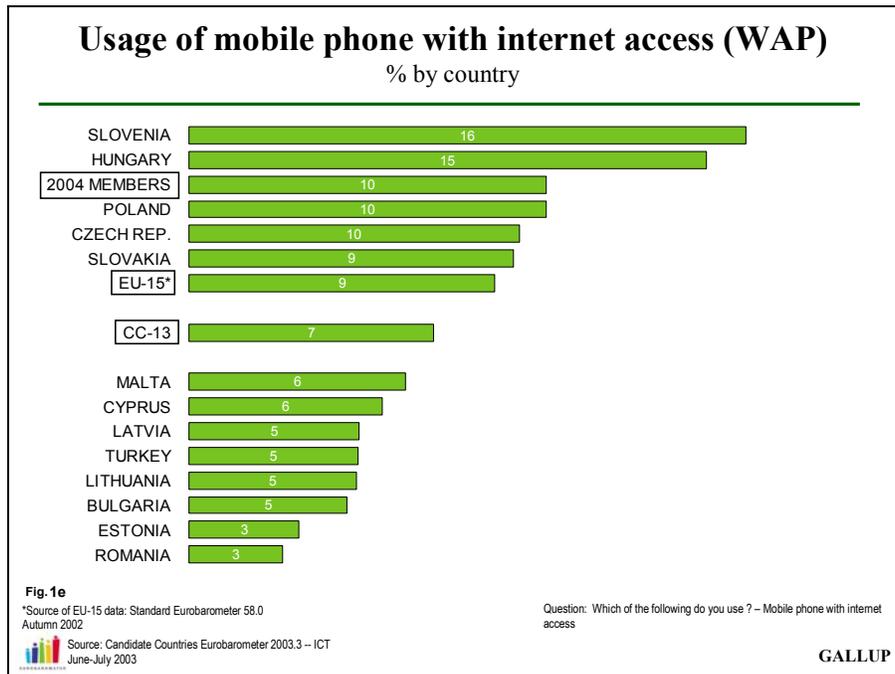

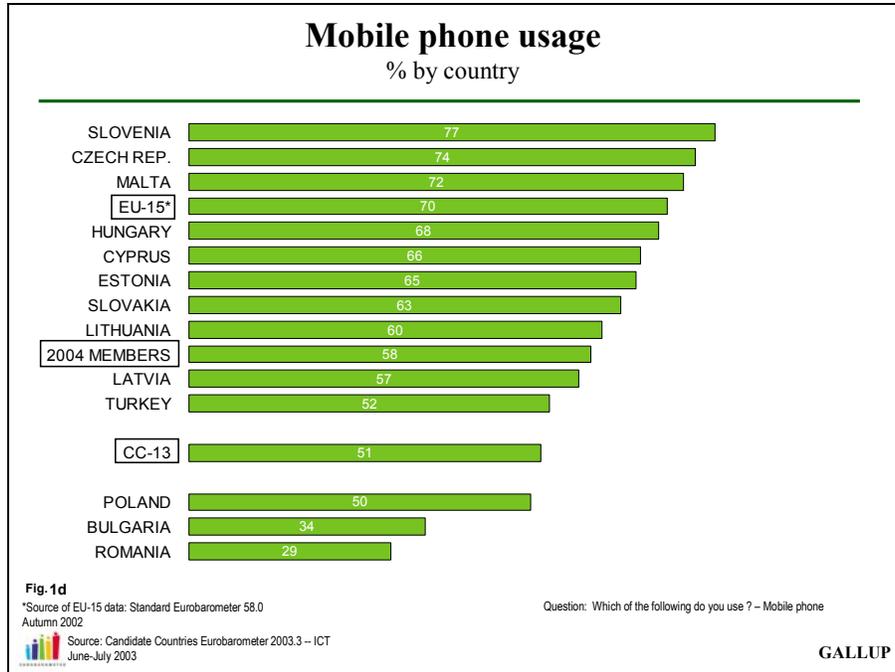

There is a large proportional gap among the countries with regard to **mobile phone with Internet access** (WAP) usage. In first place is Slovenia (19%), and Romania has the lowest proportion of usage, with 3%. Hungary is in second place, with 15% usage. 2004 member countries and EU-15 countries are almost the same with respect to WAP usage (10% and 9%, respectively). The proportion of usage in CC-13 countries is not as high (7%).

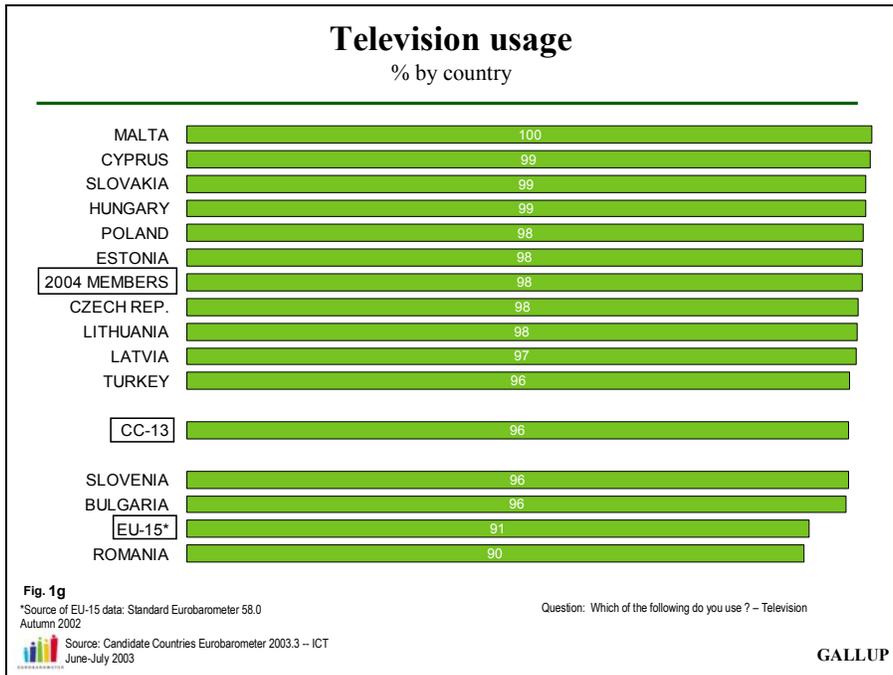

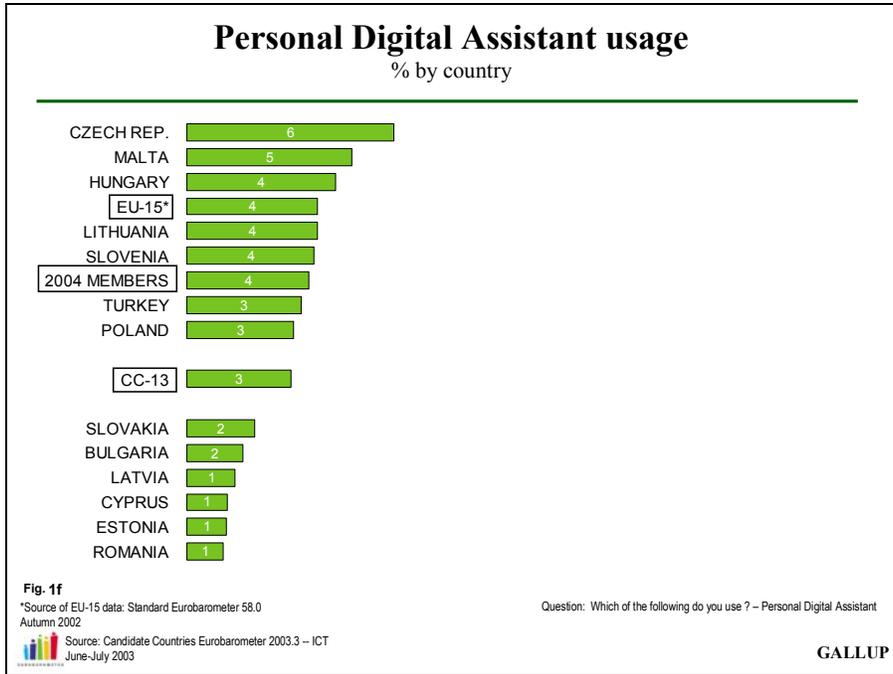

Cable television usage shows a different pattern. The Maltese are in first place, with 69% usage of cable television, followed by Romania (63%) and Estonia (59%). 2004 member countries surpass CC-13 countries in their cable TV usage (42% versus 35%), and only 31% of respondents in EU-15 countries use cable television. Turkey (11%) has the lowest cable TV usage rates.

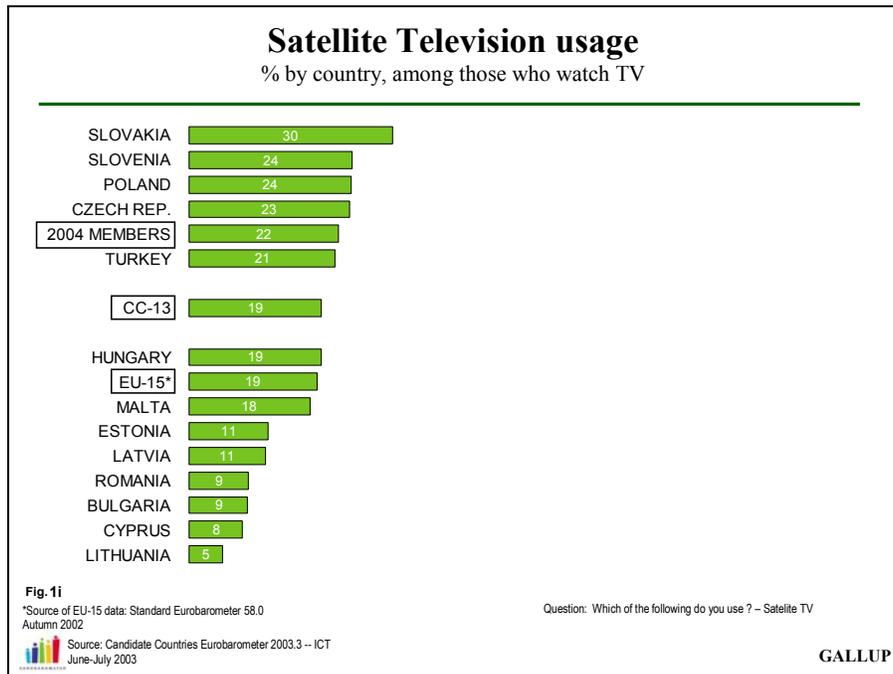

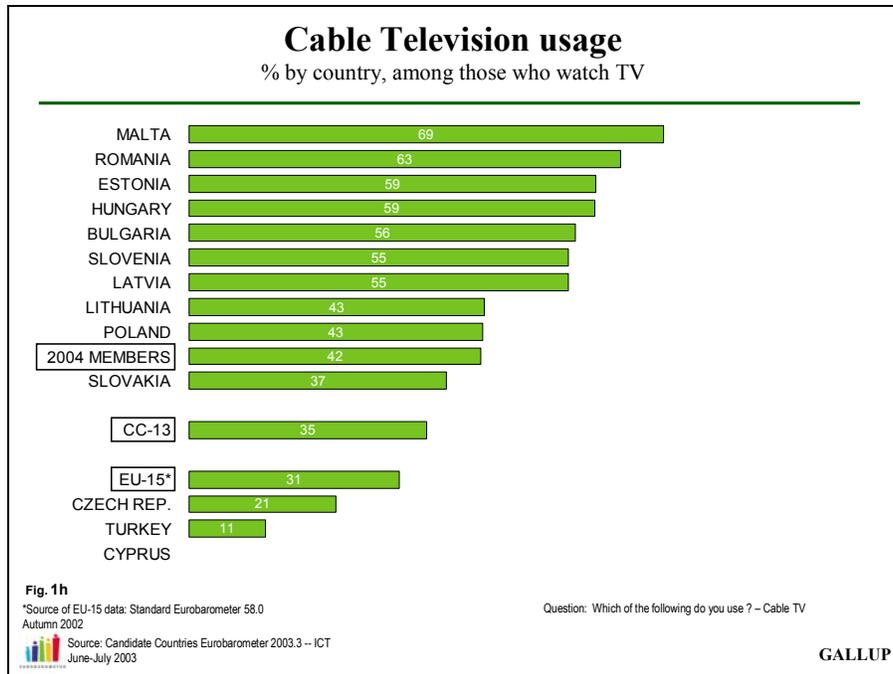

Digital television usage is lower than the usage of **satellite television**. The highest percentage of digital television usage (9%) is found in Slovenia, followed by Malta (also 9%) and Poland (7%). In contrast, for *satellite television* usage, Slovakia is in first place, with 30% of respondents indicating they use it, followed by Slovenia (24%). Cypriots and Lithuanians use satellite television in the lowest proportions (8% and 5%, respectively). (see ANNEX Table 1.2)

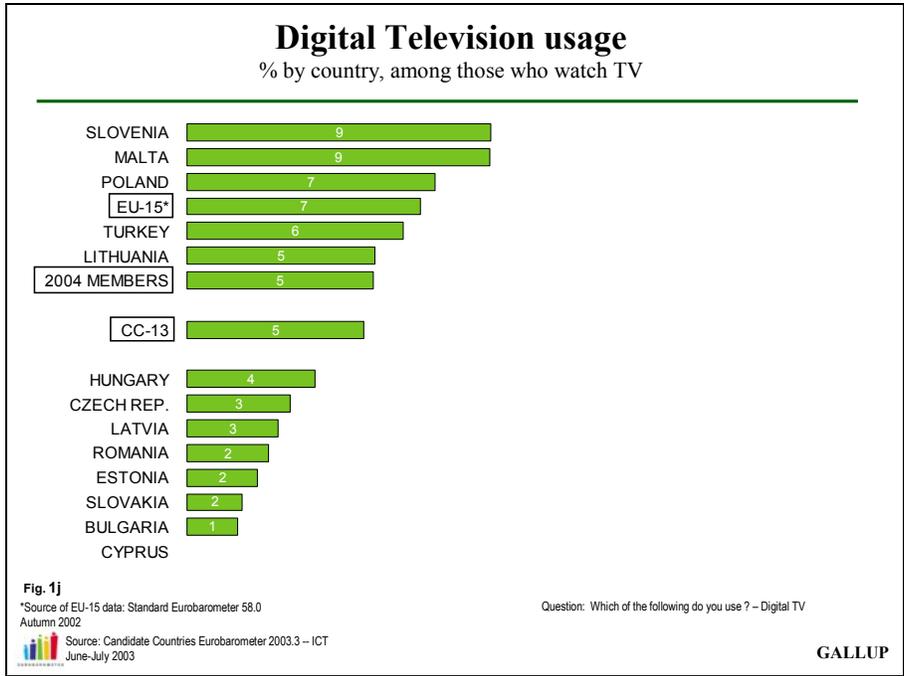

Respondents use the **Personal Digital Assistant** in proportions that are lower than those for any other device. Altogether, 6% of Czechs use it; they are most likely of the countries measured to use a PDA. PDA usage is next most common among the Maltese (5%) and Hungarians (4%). (FIGURES 1b-1j)

2. Internet usage in various locations

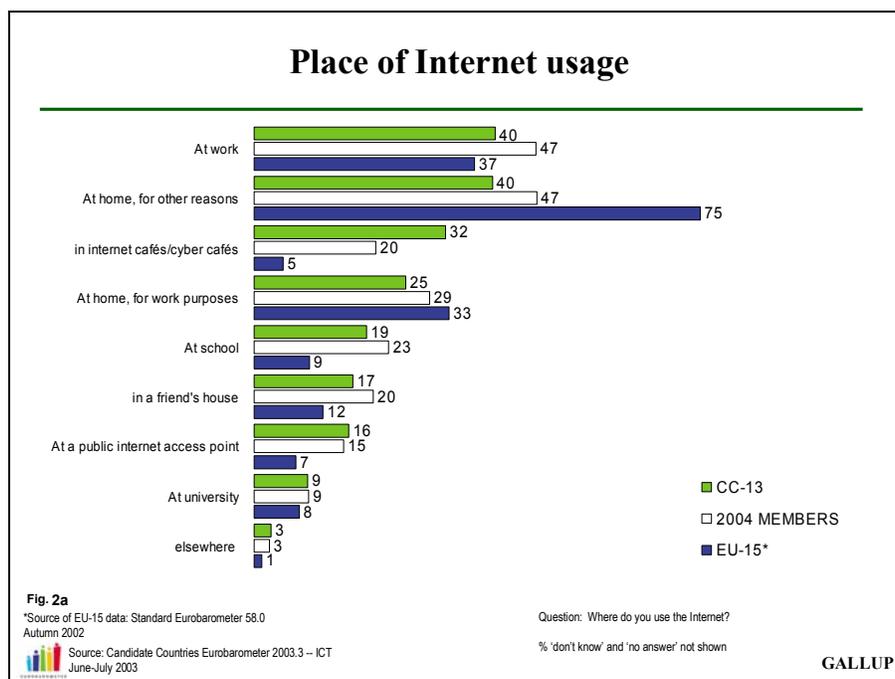

Home Internet usage in EU-15 countries is quite different from Internet usage patterns elsewhere. Of those who use the Internet in EU-15 countries, 75% use the Internet at home. The proportion is 47% in 2004 member countries and 40% in CC-13 countries. On the other hand, Internet usage patterns at work vary less among the three groups of countries: 47% of Internet users from the 2004 member countries, 40% of those from the CC-13 countries and 37% of those from the EU-15 countries use it at work.

Internet cafés and cyber cafés are also popular among Internet users in CC-13 countries; about one-third of Internet users from these countries use these places for surfing.

Thirty-three percent of Internet users in the EU-15 countries turn on the computer at home and connect to the Internet for work purposes.

School is also a place where the Internet is used, especially in 2004 member countries (23% of Internet users from these countries use the Internet in school). One in five Internet users from 2004 member countries indicates that they use the Internet at a friend's house (20%).

Public Internet access points and universities are not so popular among respondents; 8%-9% of Internet users connect to the Internet at a university, while no more than 16% use the Internet at a public access point. (see ANNEX TABLE 2.1)

Taking a detailed look at the results by country, we can see that **Internet usage at work** is the most popular in Hungary, with 55% of Internet users indicating they use the Internet there. Czechs (53%) and Estonian (51%) Internet users mention usage at work next most often. Lower proportions of Internet users from CC-13 and EU-15 countries (40% and 37%, respectively) than from 2004 member countries (47%) use the Internet at work. The lowest percentages of Internet users using the Internet at work are the Maltese (33%), the Romanians (30%) and the Turks (29%).

Internet usage at home for reasons other than work is the most popular among Cypriot (45%) and Czech (39%) Internet users. EU-15 countries are in third place, with 33%. Turkish and Latvian Internet users are not as likely to use the Internet in this way: only 19% of Turks and 18% of Latvians say they use the Internet at home for other purposes.

Internet cafés and cyber cafés are very popular as places to use the Internet in Latvia (where 54% of Internet users use these cafés) and in Estonia (52%), followed by Poland (32%). In contrast, the proportion is lower in EU-15 countries (17%), and in 2004 member countries (13%) and CC-13 countries generally (11%). Internet users in Hungary (5%) and Lithuania (6%) are least likely to use Internet cafés to access the Internet.

Slovakian and Czech Internet users use the **Internet at home for work purposes** in the highest proportions (45% and 39%, respectively); 33% of Latvian Internet users use the Internet in this way. Turkish and Hungarian Internet users use it at home for work purposes in the lowest proportions (18% and 19%, respectively).

Lithuanians (31%), Latvians (24%) and Romanians (23%) who use the Internet are most likely of all the CC-13 respondents to connect to the **Internet in a friend's house**, while Slovenians (12%) and Hungarians (6%) are least likely.

It is interesting to see that **universities** are not the most popular places to use the Internet; respondents mention them in almost the lowest proportions. Romanians and Hungarians who use the Internet are in first and second place (15% each) when it comes to usage at universities, while Czechs, Bulgarians (7% each) and Slovenians (6%) have the lowest proportion of mentions.

Schools are a bit more popular among respondents who use the Internet. Slovenians and Poles are most likely of all the CC-13 respondents to connect to the Internet there, with mentions of 33% and 28%, respectively. Turkish and Hungarian Internet users mention schools least frequently (10% and 9%, respectively).

Polish and Slovakian Internet users are most likely of all the CC-13 respondents to mention **public Internet access points** as a place to connect to the Internet. In Poland, this proportion is 40% and in Slovakia it is 31%. Few Internet users from 2004 member countries and CC-13 countries access the Internet at these locations; only 6% and 7%, respectively, mention them. (see *FIGURES 2b-2i* and *TABLE 2* on the next page)

Table 2. Places of Internet usage
(% of mentions among Internet users, the three most frequent responses, by country)

Bulgaria		Malta	
At work	35	At work	33
At a public Internet access point	23	At school	28
At school	21	At home, for other reasons	27

Cyprus		Poland	
At work	48	At work	44

Lithuania	
At work	46
In a friend's house	31
At a public Internet access point	29

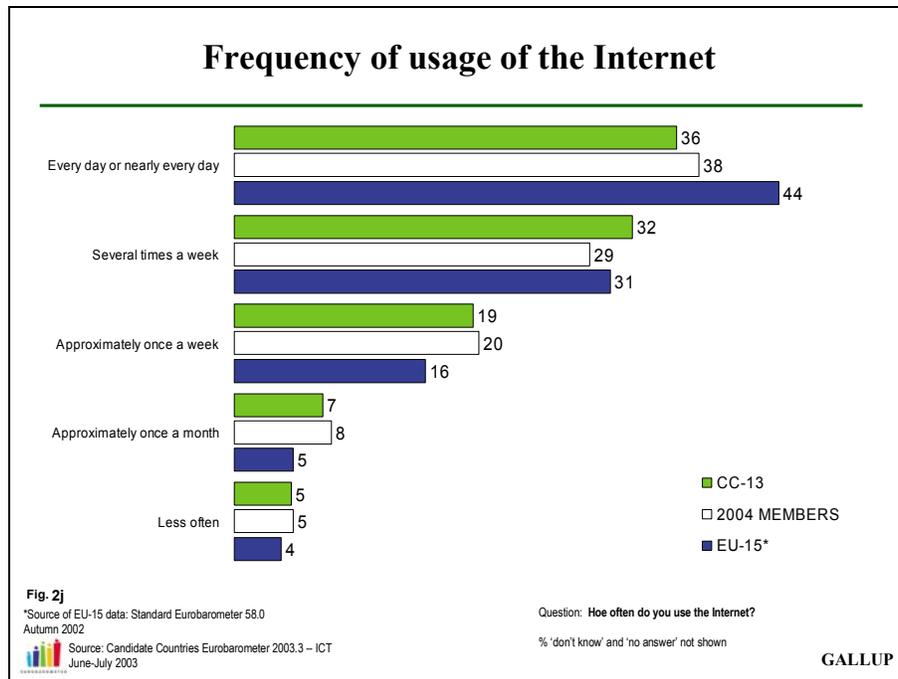

Frequency of using the Internet provides an interesting picture as well. In EU-15 countries, the plurality of Internet users (44%) use the Internet every day or nearly every day. This proportion is somewhat lower in CC-13 countries (36%) and in 2004 member countries (38%). Internet usage “several times a week” is mentioned next most often. Internet users from CC-13 countries give “several times a week” the highest percentage of mentions (32%), followed by those from EU-15 countries (31%) and 2004 members (29%). (see ANNEX TABLE 2.2)

Twenty percent of Internet users from the 2004 member countries use the Internet approximately once a week, as do 19% of CC-13 respondents, while in EU-15 countries, this proportion is only 16%.

“Less often” than once a month is mentioned by the lowest proportion of Internet users -- 5% in both CC-13 countries and 2004 member countries, and 4% in EU-15 countries.

3. Living without Internet

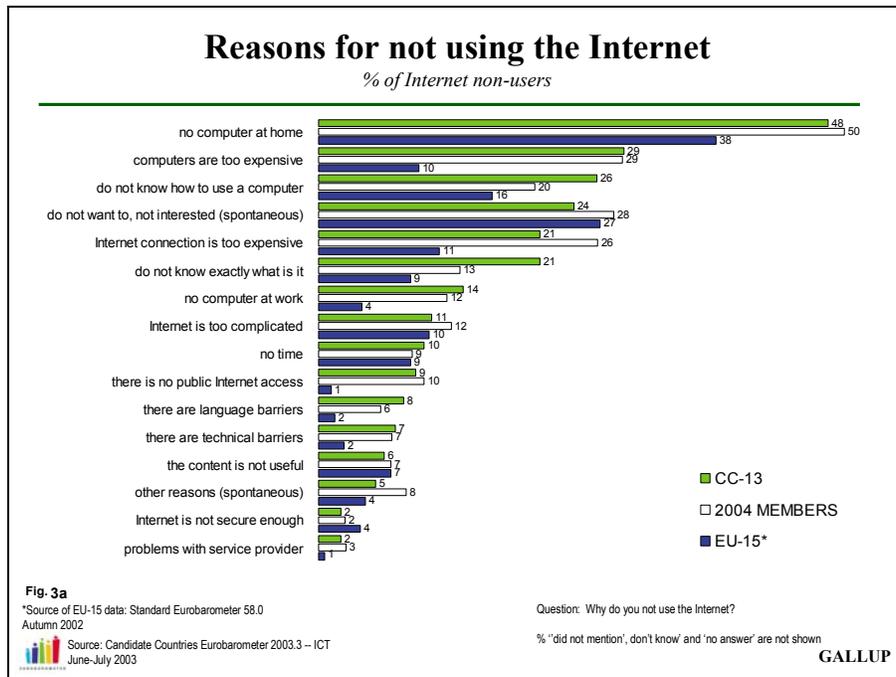

Three-quarters of the population from candidate countries (76%) and almost as many from the 2004 member countries (69%) say they do not use the Internet. This subchapter presents the reasons the candidate countries' population does not use the Internet and what respondents think would encourage their Internet usage.

Why respondents do not use the Internet

The candidate countries' population doesn't use Internet first of all because they don't have a computer at home (48% of those who do not use the Internet give this as a reason). The reason mentioned second most frequently for not using the Internet is that computers are too expensive (29%). The third most frequently mentioned reason people from candidate countries don't use the Internet is because they do not know how to use a computer (26%). The reasons respondents mentioned least frequently are that there are problems with the service provider and that the Internet is not secure enough (2% each).

Looking at the data as to why the 2004 member countries' population does not use the Internet, there is nearly the same ranking of the reasons: those from the 2004 member countries' population who do not use the Internet mention that there is no computer at home (50%), that computers are too expensive (29%), and in third place, we see the spontaneous reason that they do not want to use the Internet -- they are not interested in it (28%). The reason for not using the Internet mentioned by the smallest percentage of the 2004 member countries' population not using the Internet (2%) is that the Internet is not secure enough.

Comparing our measures to the 2002 data from European Union countries, it can be emphasized that virtually all these reasons for not using the Internet are mentioned by lower percentages of people in EU-15 than in CC-13 or in 2004 member countries. However, the ranking of the reasons is not so different: the top reason, similar to that for the other countries, is that respondents who don't use the Internet have no computer at home (38%). The second most frequently mentioned reason is they do not want to use the Internet -- they are not interested in it (27%); and the third most frequently mentioned reason is that they do not know how to use a computer (16%). Reasons mentioned in the lowest percentages by EU-15 respondents who don't use the Internet are that there is no public Internet access and that there are problems with the service provider (1% each). (see also *ANNEX TABLE 3.1*)

Comparing the country-level data, not using the Internet because there is *no computer at home* is mentioned in all candidate countries, and is the most frequently mentioned reason in 10 of them (the lowest rate of mentions in first place is 35% in Romania, and the highest, 58%, is in Estonia).

Respondents mentioned *computers are too expensive* as one of the top three reasons for not using the Internet in 8 of the 13 countries, and in 6 countries this reason is in second place (with the lowest mention, 28%, in Estonia, and the highest, 43%, in Slovakia). In Romania (21%) and in Turkey (32%) this reason is mentioned third most often.

Mentioned as one of the top three reasons for not using the Internet in 7 of the 13 candidate countries is that people *don't know how to use it* – in Turkey this is the reason mentioned second most frequently (35%) and in the other 6 countries, third most (with the lowest rate among these 6 countries, 20%, in Malta 20%, and the highest, 43%, in Slovakia).

In 6 of the 13 candidate countries, one of the top three reasons for non-use of the Internet is that respondents *do not want to use it -- they are not interested in it*. In Cyprus (51%), in Malta (41%), and in Slovenia (28%) this reason receives the most mentions. (ANNEX TABLE 3.1)

Table 3a. Reasons for not using the Internet
(% of mentions given by Internet non-users, by country; top three mentions given)

Bulgaria		Malta	
No computer at home	44	Do not want to, not interested	41
Computers are too expensive	29	No computer at home	32
Do not know how to use a computer	27	Do not know how to use a computer	20
Cyprus		Poland	
Do not want to, not interested	51	No computer at home	51
No computer at home	20	Computers are too expensive	30
No time	17	The Internet connection is too expensive	25
Czech Republic		Romania

No computer at home	54	No computer at home	52
Computers are too expensive	33	Do not know how to use a computer	35
The Internet connection is too expensive	29	Computers are too expensive	32
Lithuania			
No computer at home	54		
Computers are too expensive	34		
Do not know how to use a computer	33		

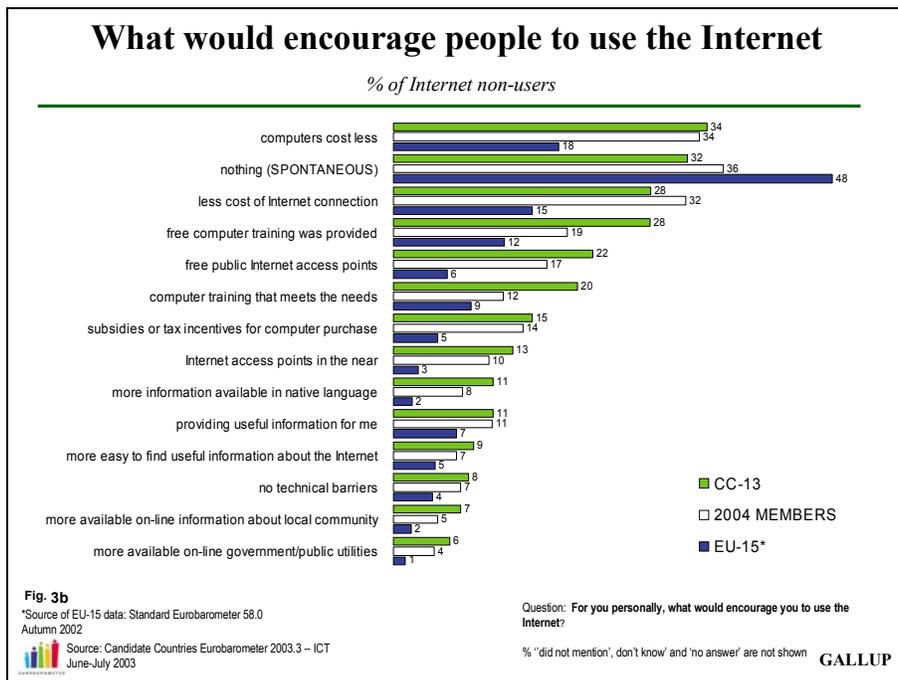

What would encourage the non-users to use the Internet?

If the computers cost less, this could encourage the candidate countries' population to use the Internet; this was the most frequently mentioned answer (34% of those not using the Internet said this). But a rather large proportion of people in these countries (32%) answered that nothing could encourage them to use the Internet. In ranking answers by frequency of mention, the third- and fourth-place answers, according to those from the candidate countries who do not use the Internet, involve lowering the cost of Internet connection and providing free computer training (28% each) as ways to encourage their Internet usage. Having more

government or public utilities available online would encourage the smallest percentage of Internet non-users from the candidate countries' population to use the Internet (6%).

The highest proportion of Internet non-users from 2004 member countries answered that nothing could encourage them to use the Internet (36%). Reducing the cost of computers (34%) or the cost of Internet connection (32%) would encourage about one-third of the 2004 member countries' Internet non-users to use the Internet. However, having more government or public utilities available online would not encourage many to use the Internet (4%).

Comparing the European Union countries' Internet non-users' answers to those from candidate and 2004 member countries (FIGURE 1.3b), we find the same top three answers, but with rather different percentages. Nothing could encourage almost half of European Union Internet non-users to use the Internet (48%) -- this is the opinion held by largest proportion of this group. But about one in six mention that if either the computer (18%) or the Internet connection (15%) cost less, these could give them an impetus toward Internet usage. (see also ANNEX TABLE 3.2)

Analysing the country-by country data, we emphasize that if the computers would cost less, Internet non-users in 12 of 13 countries say (as one of their top three answers) this would encourage them to use the Internet. In Estonia (38%), in Lithuania (39%) and in Poland (38%) this answer is mentioned most often.

Except for Lithuania and Turkey, each candidate country's Internet non-users spontaneously mention that nothing would encourage them to use the Internet as one of their top three answers. This is the first-place response in eight countries (with the lowest rate among these eight, 30%, found in Romania and the highest, 64% each, found in Cyprus and Malta).

Less cost of Internet connection would also encourage the Internet non-users in 7 of the 13 candidate countries; this answer is the first-place answer in Slovakia (41%). The provision of free computer training is mentioned as one of the top three in seven candidate countries. For more detailed data, see the table below and the ANNEX TABLE 3.2.

Table 3b. What would encourage respondents to use the Internet
 (% of mentions among those who do not use the Internet, by country;
 top three mentions given)

Bulgaria	
Nothing (SPONTANEOUS)	37
Computers cost less	29
Free computer training was provided	27

Malta	
Nothing (SPONTANEOUS)	64
Free computer training was provided	14
Computers cost less	13

Cyprus

Less cost of Internet connection	41
Computers cost less	39
Nothing (SPONTANEOUS)	34

Hungary	
Nothing (SPONTANEOUS)	49
Less cost of Internet connection	26
Computers cost less	23

Slovenia	
Nothing (SPONTANEOUS)	41
Computers cost less	21
Less cost of Internet connection	18

Latvia	
Nothing (SPONTANEOUS)	39
Computers cost less	31
Free computer training was provided	27

Turkey	
Free computer training was provided	41
Computers cost less	40
Computer training that meets the needs	34

Lithuania	
Computers cost less	39
Less cost of Internet connection	39
Free computer training was provided	31

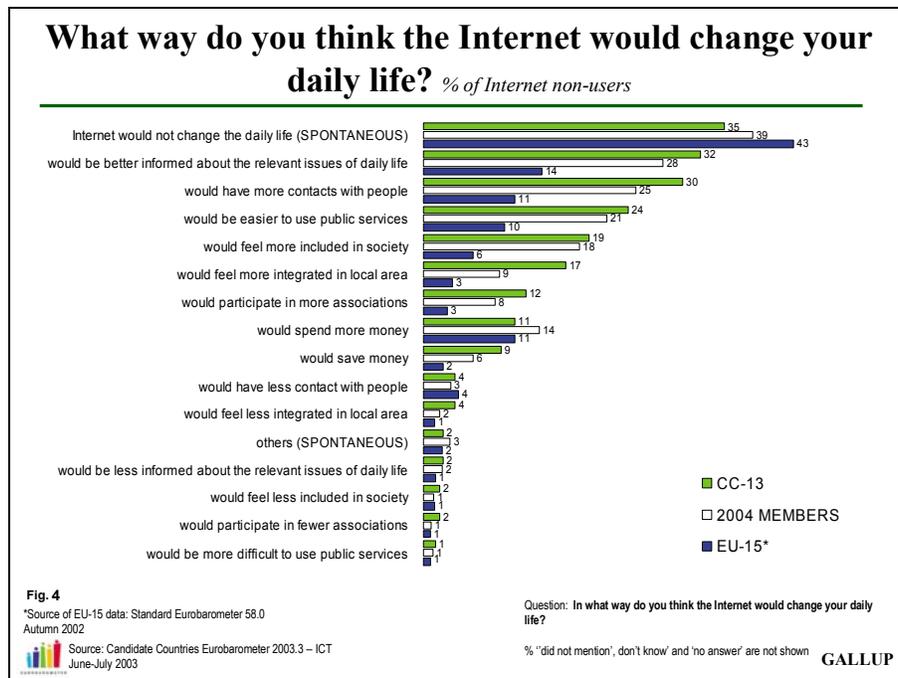

4. Expected changes in daily life using the Internet

As *FIGURE 1.4a* shows below, most of the Internet non-users from candidate countries, as well as those from 2004 member countries and European Union countries, mention spontaneously that the Internet would not change their daily lives (35%, 39%, and 43%, respectively). It is interesting to note that the European Union population mentioned this at a higher rate than did the CC-13 or 2004 member countries' populations.

Thirty-two percent of the candidate countries' Internet non-user population, 28% of the 2004 member countries' population, and, with the lowest rate, 14% of the European Union countries' population (the second-place response for all of them) mention that if they would use the Internet, they would be better informed about the relevant issues of daily life.

In third place for all three groups (tied for third with "would spend more money" for EU-15 respondents) is the answer that Internet users would have more contacts with people. This is the opinion of 30% of the population from the candidate countries, 25% of those from the 2004 member countries and 11% from the European Union countries.

Only 1% each of the population from the CC-13, 2004 member and European Union countries answered that if they would use the Internet, it would be more difficult to use public services. For more detailed data, see also *ANNEX TABLE 4*.

As *TABLE 4* shows below, in each of the candidate countries, the answer that the Internet would not change the daily life of the population appears as one of the top three given. In nine countries, this answer is mentioned most frequently of all (with the lowest rate among the nine in Romania, at 30%, and the highest in Cyprus, at 61%).

Each of the candidate countries' respondents say they would be better informed about the relevant issues of daily life if they would use the Internet. This possibility is mentioned as one of the top three in each country, and in Lithuania (38%), Slovakia (38%) and Turkey (42%) it is the first-place answer.

Except in the Czech Republic and Lithuania, each of the candidate countries' Internet non-users mention as one of the top three answers that if they would use the Internet, they would have *more contacts with people*. In Bulgaria, this is the most frequently mentioned answer (29%). For more information, see *TABLE 4* below (and *ANNEX TABLE 4* for more detailed figures)

Table 4. The way the Internet would change daily life
(% of mentions among those who do not use the Internet, by country;
top three mentions given)

Bulgaria		Malta	
Would have more contacts with people	29	Internet would not change the daily life (spont.)	53
Would be better informed about the relevant issues of daily life	28	Would be better informed about the relevant issues of daily life	23
Internet would not change the daily life (spont.)	28	Would have more contacts with people	21

Lithuania			
Would be better informed about the relevant issues of daily life	38		
Internet would not change the daily life (spont.)	29		
Would feel more included in society	23		

5. Main purposes of Internet usage

This chapter encompasses main areas of Internet usage, reasons for using the Internet and different kinds of computer training.

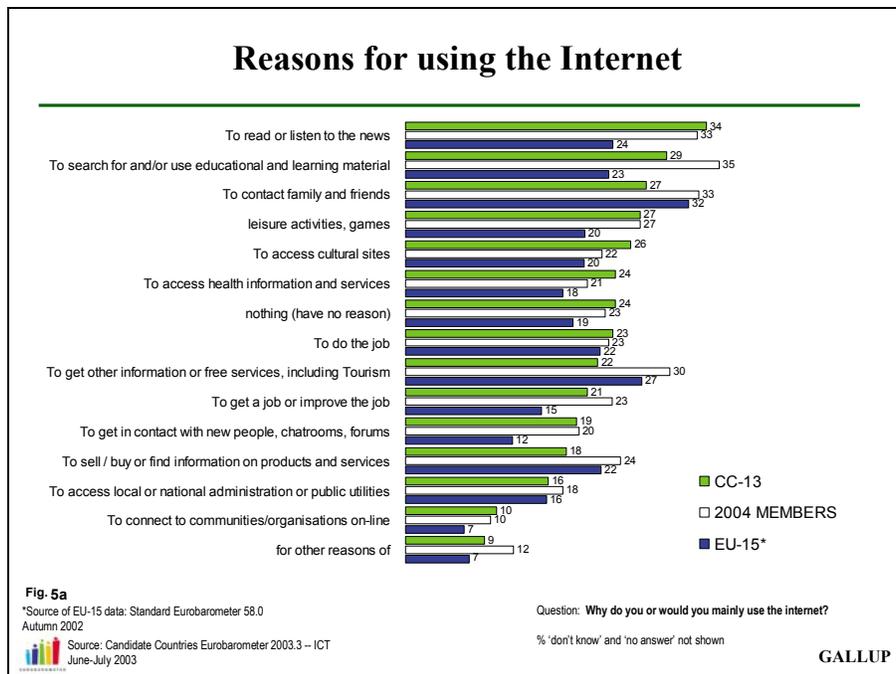

People were interviewed about their reasons for using the Internet. In many cases, respondents connect to the Net to read or listen to the news. Thirty-four percent of Internet users from the CC-13 countries mention this as a reason to get online, making it the most frequently mentioned reason. This proportion is slightly lower in 2004 member countries (33%) and is somewhat lower in EU-15 countries (24%).

In the CC-13 countries, 29% of Internet users use the Internet to search for educational or learning material, compared to 35% in 2004 member countries and 23% in EU-15 countries.

Internet users from 2004 member countries connect to the Internet in the highest proportion (35%) to search for and/or use educational and learning material, followed by connection to contact family and friends, and to read or listen to news (33% each).

Respondents are also interested in cultural sites and health information available on the Internet, which are the fifth- and sixth- most popular answer for the three groups of countries. Cultural sites are mentioned by the highest percentage in CC-13 countries (26%), as is accessing health information and services (24%).

Getting other information or free services, including tourism, from the Internet is frequently mentioned among respondents from 2004 member countries (30%); in the CC-13 countries, this percentage is 22%.

Fewer respondents mention searching for a job or improving one's job: 21% of respondents in the CC-13 countries, 23% in the 2004 members countries and 15% in the EU-15 countries connect to the Internet for this reason.

Chat rooms, forums and contacting new people on the Internet are even less popular, with 12% of the EU-15 countries using the Internet for this purpose. A higher proportion of 2004 member countries' respondents chat and get in touch with other people on the Internet (20%).

Connecting for communities and organizations online is the least popular specific reason for using the Internet. Ten percent of those from the CC-13 and 2004 member countries mention it, versus 7% of those from the EU-15 countries. (see *ANNEX TABLE 5*)

Taking a closer look at the individual country results, it is clear Turks are more likely than any respondents from other CC-13 countries to use the Internet **to do the job** (31%). Cypriots (29%) and Lithuanians (27%) mention this reason next most often. The Maltese (14%) and Romanians (8%) connect to the Net "to do the job" in the lowest proportions. (*FIGURES 5b-5n.*)

On the other hand, **to get a job or improve the job** is mentioned most frequently as a reason for connecting to the Net in Slovakia (30%) and in Poland (26%). In 2004 member countries overall, 23% use the Internet for this purpose, and in the CC-13 countries, 21% do. Slovenians (15%) and Maltese (11%) mention this reason least frequently.

Poles (42%), and Maltese (32%) use the Internet to **search for educational material** in highest proportions. The overall percentage for the 2004 member countries is 35%. In EU-15 countries, this reason for using the Internet is not as popular (23%); the Romanians use the Internet least for this purpose (20%).

Using the Internet as an option **to sell or buy products** or to receive information on products is most popular in the Czech Republic, as 33% of the Czechs use the Internet for this purpose. Slovenian (28%) and Polish (26%) respondents are in second and third place, respectively, on this measure. Low proportions of Turks (12%) and Cypriots (12%) use the Internet for this reason. Overall, this use of the Internet is somewhat popular in CC-13 countries (18%) and in EU-15 countries (22%).

Getting information or free services, including tourism, on the Internet is most popular in the Czech Republic (41%), and a large percentage of Slovaks also use the Net to do this (38%). Overall, about 3 in 10 from 2004 member countries (30%) and EU-15 countries (27%) connect to the Internet for this purpose. Cypriots and Turks do not often access the Internet to get information or free services: only 17% of Cypriots and 13% of Turks say they do this.

Estonians (41%) and Turks (40%) **read or listen to news** on the Internet in the highest proportions, in contrast to the Maltese (23%) and the Cypriots (23%).

Of those who connect to the Internet **to access cultural sites**, Turks and Hungarians are most likely to do so (34% and 30%, respectively). Slovenians and Cypriots are least likely to give this as a reason for using the Net (14% and 11%, respectively).

Czechs (32%) and Slovaks (26%) connect to the Internet in the highest proportions **to access local or national administration or public utilities**, even though this kind of information search is not the favoured one. Altogether, 9% of Romanians and 7% of Cypriots surf the Net to find this kind of information.

For accessing health information and services, the proportions mentioning this as a reason to use the Internet are similarly low. Turks mention it most frequently (31%), followed by Slovaks and Czechs (25% each). Overall, the CC-13 countries as a group come in fourth place (24%). This reason is mentioned least frequently in Romania (17%), Hungary (17%) and Cyprus (15%).

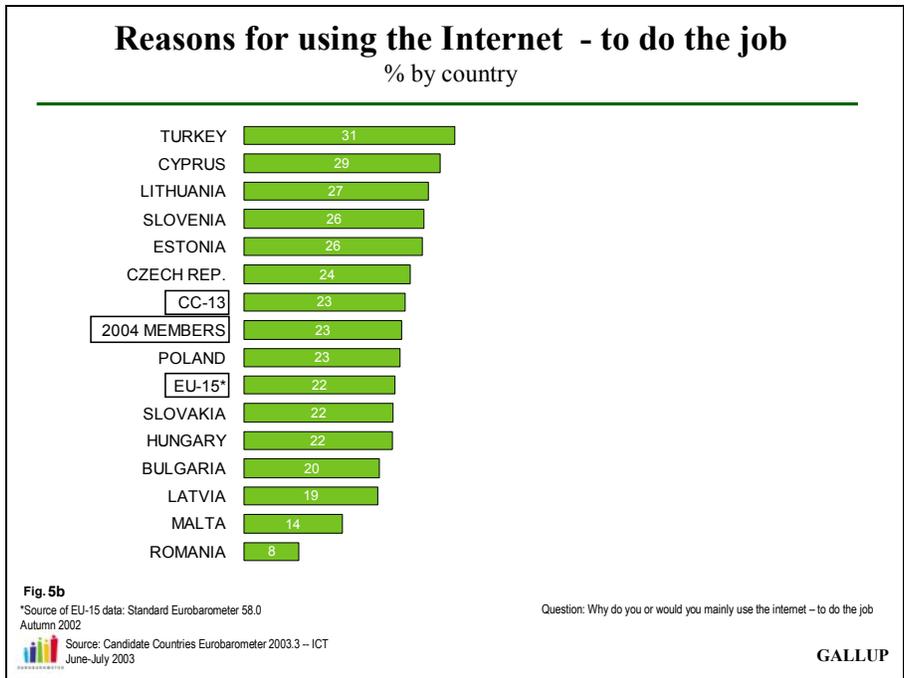

Contacting family members and friends on the Internet is popular in Slovakia (38%) and in Poland (36%); these countries mention it in the highest proportions. In 2004 member countries, this proportion is 33%, while in EU-15 countries, 32% of respondents mention it as a reason to connect to the Internet.

Romanians and Cypriots are least likely to use the Net to get in touch with family and friends -- 20% of the Romanians and 16% of the Cypriots mention it.

To get in contact with new people is another way to use the Net. Bulgarians (25%) and Poles (22%) are most likely to connect to the Net for chat rooms, forums and contacting new people. In the EU-15 countries and in Cyprus, only 12% use the Internet for this purpose.

Using the Internet for **leisure activities and games** is widespread in Lithuania (37%) and in Slovakia and the Czech Republic (30% each). Twenty-seven percent of respondents in both 2004 member countries and CC-13 countries mention this option as a reason to connect to the Internet. Romanians (20%) and Maltese (19%) are least likely to mention this reason.

The least popular specific reason to use the Internet is **connecting to communities or organizations**. The respondents most likely to mention this are the Maltese and the Turks – still, only 14% and 13%, respectively, do so. Only 10% of respondents from both the CC-13 countries and 2004 member countries, and just 7% of those from the EU-15 countries give this as a reason for using the Internet.

6. Computer training

Almost half of the respondents in Lithuania (46%) have participated in computer training. Estonians (42%) and Slovenians (38%) are next most likely to have had training. The Turkish and Romanian respondents are least likely to have had any kind of computer training: 16% and 14%, respectively, say they have had such training. (see ANNEX TABLE 6.1)

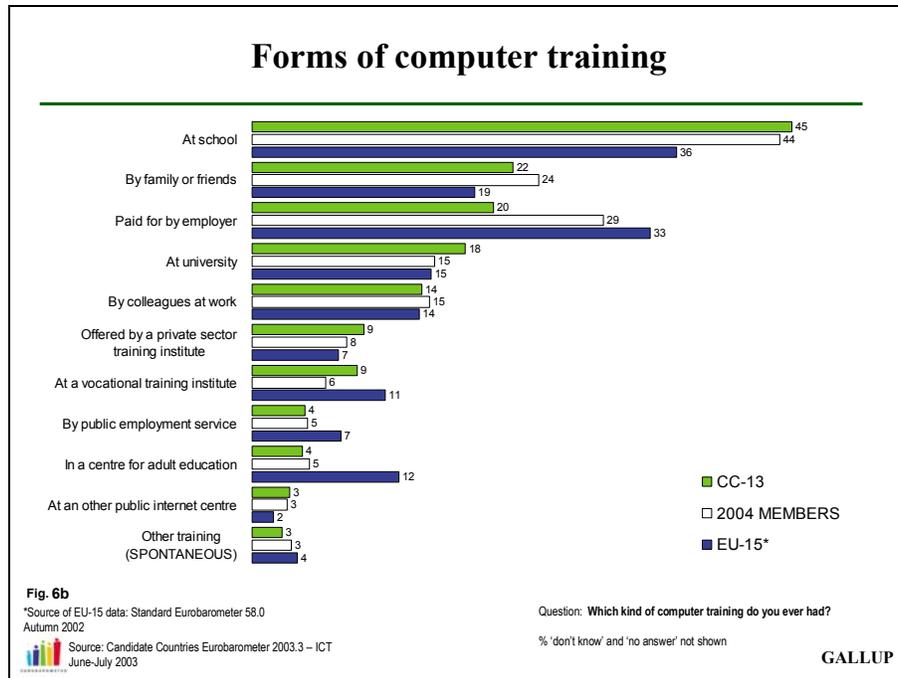

School is mentioned most frequently as the source of the computer training, in all three groups of countries: CC-13 countries (45%), 2004 member countries (44%), and (though the frequency of mention is a bit lower) EU-15 countries (36%).

Computer training given by **family or friends** is the second most widespread source of computer training in the CC-13 countries (22%). Twenty-four percent of those in the 2004 member countries mention it.

Employer-paid computer training is quite popular in EU-15 countries, where 33% of respondents mention it, compared to the CC-13 countries, where this percentage is 20%, and the 2004 member countries, where it is 29%.

Universities also take part in training, but this option is used in somewhat lower proportions. Eighteen percent of the CC-13 countries' respondents and 15% of both 2004 member countries and EU-15 countries say this was a source of their computer training.

There is an interesting difference among the results regarding **centres for adult education**. While 12% of the EU-15 countries mention it as a computer-training source, altogether only 4% of those from CC-13 countries and 5% from 2004 member countries mention it.

Taking a detailed look at the individual country results, respondents from Slovenia (55%), Latvia and Hungary (50% each) are most likely to mention **school** as a source of computer training. Nearly the same percentage of respondents from CC-13 countries and 2004 member countries mention school (45% and 44%, respectively), compared to those from EU-15 countries, who do so in somewhat lower proportions (36%). (the country ranking of forms of training are presented on *FIGURES 6c-6l*)

Turkey and Romania are countries where schools are mentioned least frequently as computer training sources.

Universities as sources of computer training are most popular in Bulgaria (27%) and Romania (23%). In 2004 member countries and EU-15 countries, these institutions are not among the most popular computer training sources; altogether, 15% of the respondents in these countries mention them.

Computer training **paid for by one's employer** was mentioned in the highest proportion by Slovaks (42%). Czech (38%) and EU-15 respondents (33%) mention employer-paid training next most often. Turkish respondents mention it least often (3%).

As a way to learn the computer, **public employment service** is a rather unused source. Cypriots have the highest percentage of mentions, with only 9%. EU-15 countries have the next highest percentage, with 7%. There are three countries in last place: Bulgaria, Romania and Poland (3% each).

Vocational training institutes as a source of computer training are somewhat popular among Cypriots, who are most likely to have used them (20%). Romanians (15%) and Turks (14%) are next most likely to have used these training institutes for computer training. In EU-15 countries, 11% have used them, while in CC-13 countries, a smaller percentage have used them (7%).

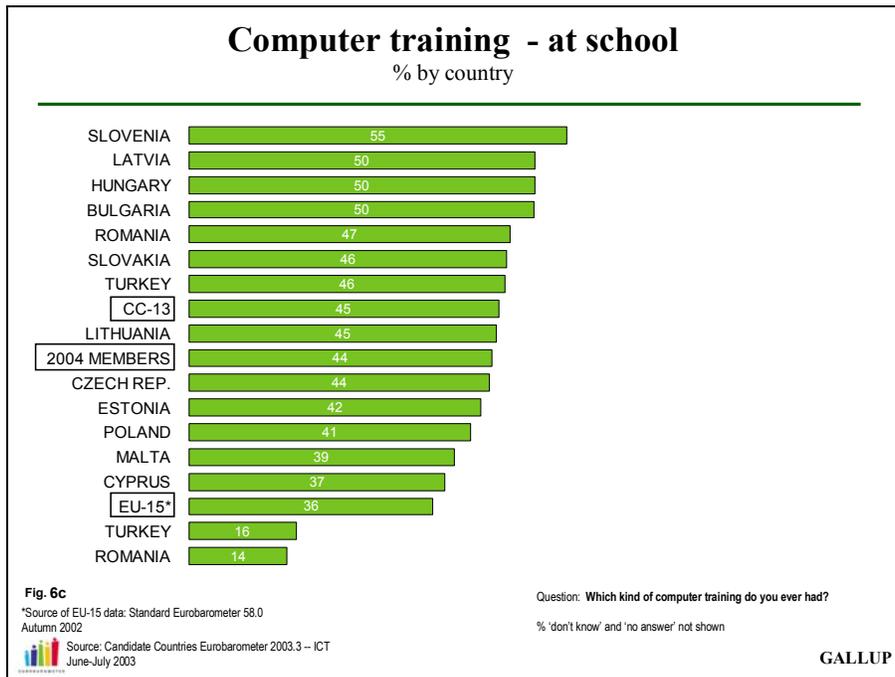

In Estonia, 17% of respondents mention **centre for adult education** as a source of computer training. Respondents from EU-15 countries (12%), Bulgaria and Latvia (9% each) are the next most likely to have had computer training in these centres. At the other end of the spectrum, 2% of both Romanians and Slovenians mention them as a training source.

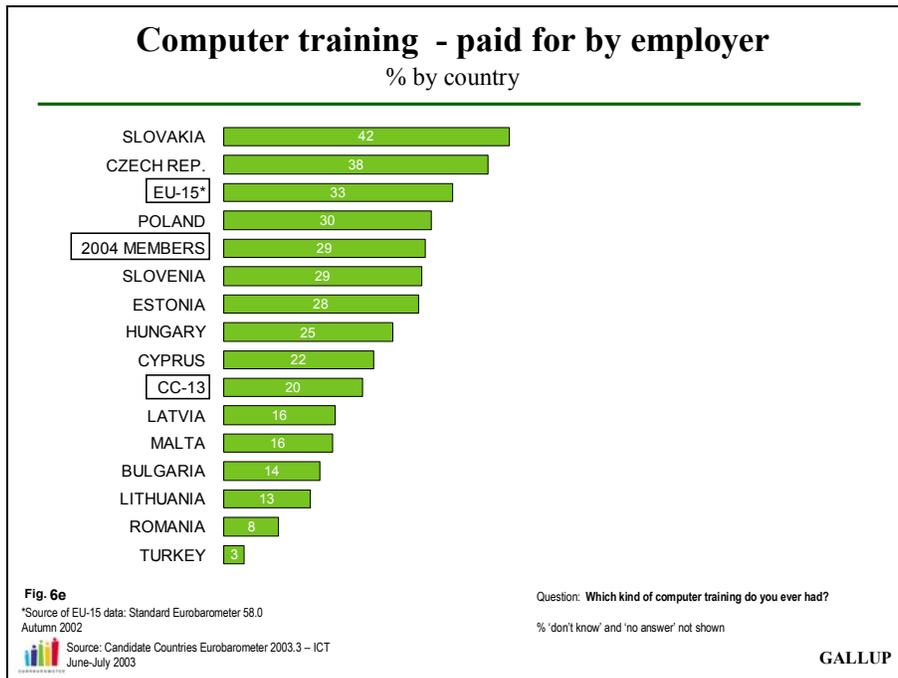

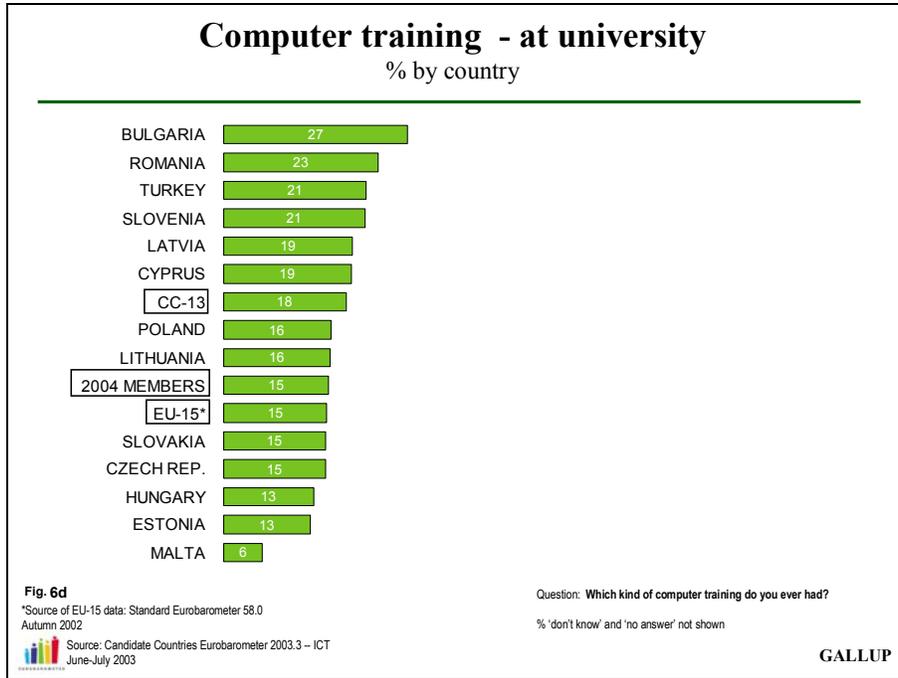

It is interesting to see that **public Internet centres** are not so popular. Bulgarians mention them most frequently; still, only 9% of Bulgarian respondents say they have received computer training there. Three percent of the respondents in CC-13 countries and 2004 member countries mention these centres, and Turks (1%) and Maltese (1%) are least likely to mention having received training there.

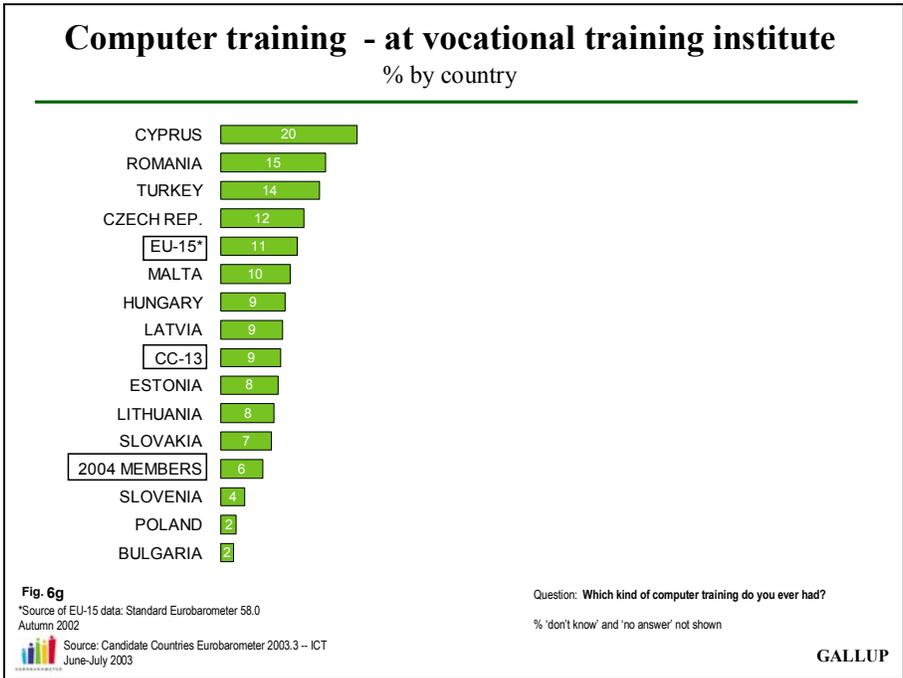

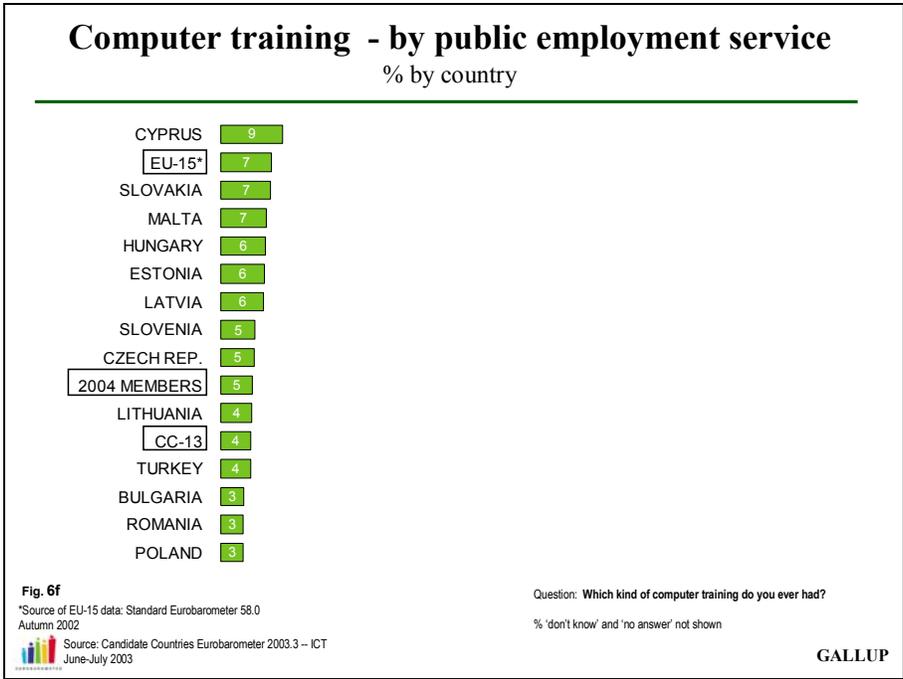

Private-sector training institutes are far more popular in Malta than in other countries. Twenty-seven percent of the Maltese mention them, with Turks – the second-place country in terms of mentions – far behind, at 15%. Slovenia (4%) and Bulgaria (3%) are least likely to mention private-sector institutes; in these countries, this source of computer training is not as popular.

Family or friends are very popular sources of computer training in Lithuania; 52% of respondents there mention friends or family as a training source. The second-place country, in terms of mentions, is the Czech Republic, but it trails Lithuania by a wide margin, with only 35% of mentions. In 2004 member countries (24%) and in CC-13 countries (22%) overall, this kind of opportunity is less popular. Turks and Cypriots mention it in the lowest proportions (Turks, 15%; Cypriots, 13%).

Twenty-nine percent of Czechs say they have received computer training from **colleagues at the workplace**; Lithuanians (27%) and Slovenians (20%) give this answer next most frequently. In 2004 member countries, 15% of the respondents mention workplace colleagues as a computer training source, as do 14% of both CC-13 and EU-15 respondents. Cypriots and Poles do not use this training option frequently; only 7% in both countries mention it. (see ANNEX TABLE 6.2)

7. Telework

Finally, our questionnaire explored basic attitudes regarding telework, that is, working from distance or from home, with applying various tools of information and communication technology.

Only 8% of the candidate countries' population regularly or occasionally teleworks, and only 3% telework regularly. Almost three-quarters of the population from CC-13 countries doesn't currently telework, but 22% of all respondents say they would be interested in doing so. Half of the CC-13 population is not interested in this way of working (50%).

Looking at respondents from the Laeken countries, 12% of them telework, with 5% doing so regularly. As in the CC-13 countries, nearly three-quarters of people from 2004 member countries indicate that they don't telework. One-quarter of the 2004 member countries' population is interested in teleworking (24%), but 49% are not interested.

As individual country-level analysis shows, the highest percentage of Maltese (23%), Slovenians (22%) and Hungarians (20%) telework either regularly or occasionally, and the highest percentages of regular teleworkers are in Malta (11%) and Hungary (10%).

The lowest percentage of regular or occasional teleworkers is found in Turkey (3%). The Bulgarians, Lithuanians and Turkish have the smallest percentages of regular teleworkers (1% each).

Looking at those who do not telework but would be interested in doing so, the Bulgarians (34%), Slovaks (32%) and Latvians (27%) have the highest percentages indicating interest and the Maltese (9%) have the lowest.

Malta (66%), Cyprus (63%) and Turkey (60%) have the highest percentages of respondents who do not telework and are not interested doing so. Lithuanians have the lowest rate of disinterest in telecommuting (27%). (see ANNEX TABLE 7)

EUROBAROMETER 2003.3

PUBLIC OPINION IN THE CANDIDATE COUNTRIES

Fieldwork: June-July 2003

Publication: September 2003

Information and Communication Technology

This survey was requested by the European Union Directorate General **Employment and Social Affairs** and coordinated by the Directorate General **Press and Communication**

This document does not represent the point of view of the European Commission.
The interpretations and opinions contained in it are solely those of the authors.

Introduction

The Candidate Countries Eurobarometer (CC-EB), gathers information from the societies that are to become members of the European Union in a way that is fully comparable with the Standard Eurobarometer. The CC-EB continuously tracks support for EU membership in each country, and records attitudes related to European issues.

This report covers the results of the wave of survey conducted in June and July 2003, in the 13 candidate countries: Bulgaria, Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Romania, Slovakia, Slovenia and Turkey.

An identical set of questions was asked of representative samples of the population aged 15 years and older in each candidate country. The sample size in Candidate Countries Eurobarometer surveys is at least 1000 people per country, except for Cyprus and Malta, in which the sample size is 500 respondents each. The achieved sample sizes of the 2003.3 wave are:

Bulgaria	1000	Latvia	1004	Slovakia	1061
Cyprus	500	Lithuania	1004	Slovenia	1000
Czech Rep	1000	Malta	500	Turkey	1000
Estonia	1007	Poland	1000		
Hungary	1003	Romania	1047	Total	12126

The survey is carried out by national institutes associated with and coordinated by The Gallup Organization, Hungary, in each of the 13 candidate countries. This network of institutes was selected by tender. All institutes are members of the "European Society for Opinion and Marketing Research" (ESOMAR) or comply with its standards.

The figures shown in this report are weighted by sex, age, region, community size, education level and marital status. The figures given for the candidate region (CC-13) as a whole and for the 2004 Member States (MS 2004) are weighted on the basis of the adult population in each country.

Due to the rounding of figures in certain cases, the total percentage in a table does not always add exactly to 100%, but to a number very close to it (e.g., 99% or 101%). When questions allow for several responses, percentages often add to more than 100%. Percentages shown in the graphics may display a difference of one percentage point in comparison to the tables because of the way previously rounded percentages are added.

Types of surveys in the Eurobarometer series

The European Commission (Directorate-General Press and Communication) organizes general public opinion, specific target group, as well as qualitative (group discussion, in-depth interview) surveys in all member states and, occasionally, in third countries. There are four different types of polls available:

- Traditional standard Eurobarometer surveys with reports published twice a year
- Telephone Flash EB, also used for special target group surveys (e.g., Top Decision Makers)
- Qualitative research ("focus groups"; in-depth interviews)
- Candidate Countries Eurobarometer

The face-to-face general public standard Eurobarometer surveys and the EB Applicant Countries surveys, the telephone Flash EB polls and qualitative research serve primarily to carry out surveys for the different Directorates General and comparable special services of the Commission on their behalf and on their account.

Information and technology

Our report presents a descriptive summary of 10 questions that were asked on the 2003 Summer Candidate countries Eurobarometer (CCEB 2003.3). We will discuss the level of usage of ITC tools and devices in the countries that apply for EU membership in comparison with the current member states. We will take a look why people do not use the Internet if they do not, and how Internet changes the life of those who use it. We will briefly describe the form and level of computer training citizens in the candidate countries received as well as their intention and experiences regarding telework.

In this first chapter, usage of different information and communication technology devices is shown. Results given include usage of Internet, reasons for not using the Internet, and how the Internet is connected to daily life.

1. Usage of devices

Taking a look at the results in detail, we can see that TV is the most widespread device among respondents. Ninety-eight percent of respondents in the 2004 member countries use TV. Television is followed by mobile phones, with a large majority of respondents (70%) in EU-15 countries indicating that they use mobile phones. The CC-13 countries use mobile phones in lower proportions (51%). It is interesting to see that Internet usage is in fifth place -- the EU-15 countries are most likely to use it (44%), followed by 2004 members (31%) and CC-13 countries (23%). Digital TV and Personal Digital Assistants are the devices that the lowest proportions of respondents use (see ANNEX TABLE 1.1). There are only 3% in both parts of Europe who say they do not use any of the listed technologies.

Regarding the country-by-country results in detail, it is apparent that the Maltese are in first place in terms of **TV use**, with 100% of the respondents indicating that they use it. Cypriots,

Hungarians and Slovaks are in second place, with 99%, and Romania is in last place, but the proportion of TV use is also high there: 9 of every 10 Romanian respondents use TV

Mobile phone usage is the highest in Slovenia (77%), followed by the Czech Republic (74%). Romania is in last place, with a much lower proportion of respondents (29%) using mobile phones.

Computer usage is highest in the EU-15 countries (52%), while in the 2004 member countries it is 41%. As for the results by country, Slovenians are in second place (after the EU-15) in this respect, with 51% of respondents indicating computer use. Bulgaria (25%), Turkey (21%) and Romania (20%) are the countries where this proportion is the lowest.

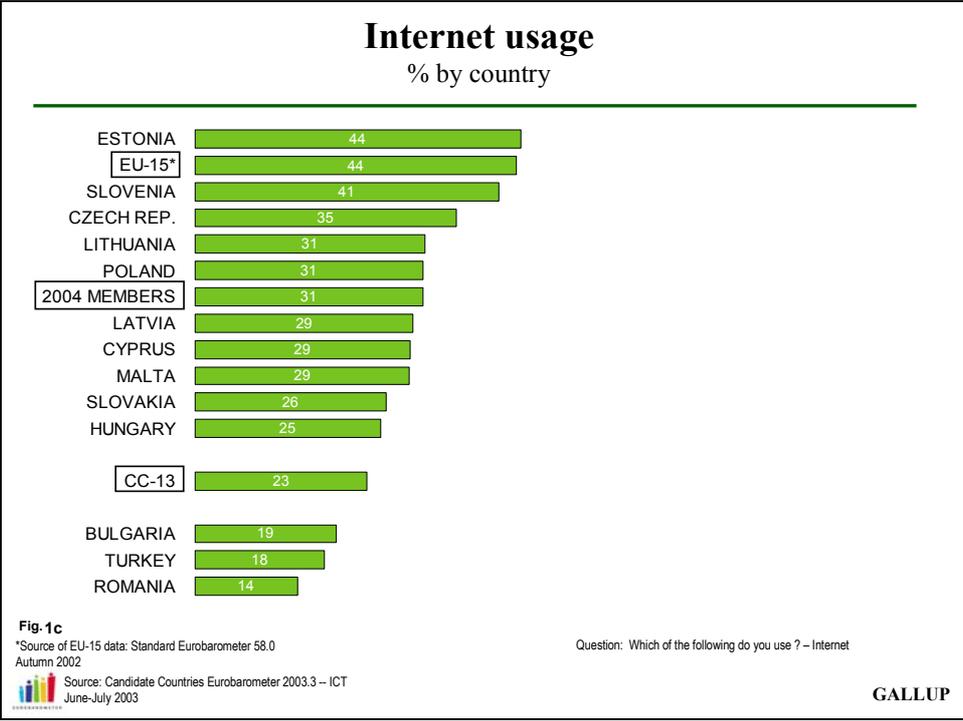

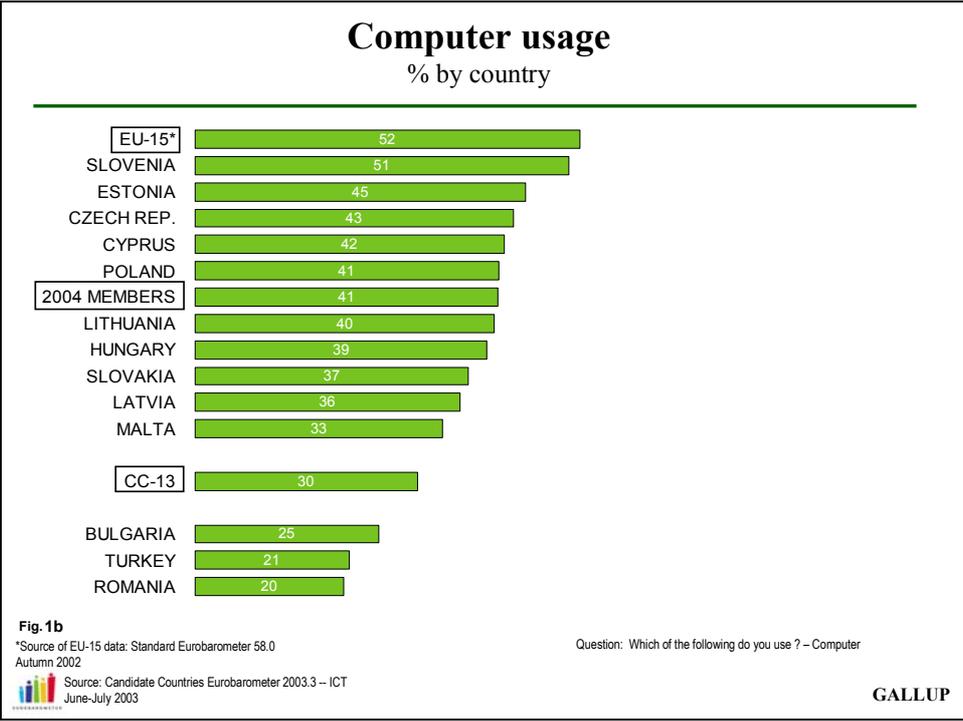

Regarding **Internet** usage, Estonians have the highest percentage of usage, 44% (the same percentage found in the EU-15 countries), followed by Slovenia (41%). Thirty-one percent of respondents from the 2004 member countries and 23% of those from the CC-13 countries use the Internet. The lowest percentages of usage are in the same countries with the lowest computer usage: Bulgaria (19%), Turkey (18%) and Romania (14%).

There is a large proportional gap among the countries with regard to **mobile phone with Internet access** (WAP) usage. In first place is Slovenia (19%), and Romania has the lowest proportion of usage, with 3%. Hungary is in second place, with 15% usage. 2004 member countries and EU-15 countries are almost the same with respect to WAP usage (10% and 9%, respectively). The proportion of usage in CC-13 countries is not as high (7%).

Cable television usage shows a different pattern. The Maltese are in first place, with 69% usage of cable television, followed by Romania (63%) and Estonia (59%). 2004 member countries surpass CC-13 countries in their cable TV usage (42% versus 35%), and only 31% of respondents in EU-15 countries use cable television. Turkey (11%) has the lowest cable TV usage rates.

Digital television usage is lower than the usage of **satellite television**. The highest percentage of digital television usage (9%) is found in Slovenia, followed by Malta (also 9%) and Poland (7%). In contrast, for *satellite television* usage, Slovakia is in first place, with 30% of respondents indicating they use it, followed by Slovenia (24%). Cypriots and Lithuanians use satellite television in the lowest proportions (8% and 5%, respectively). (see *ANNEX Table 1.2*)

Respondents use the **Personal Digital Assistant** in proportions that are lower than those for any other device. Altogether, 6% of Czechs use it; they are most likely of the countries measured to use a PDA. PDA usage is next most common among the Maltese (5%) and Hungarians (4%). (*FIGURES 1b-1j*)

2. Internet usage in various locations

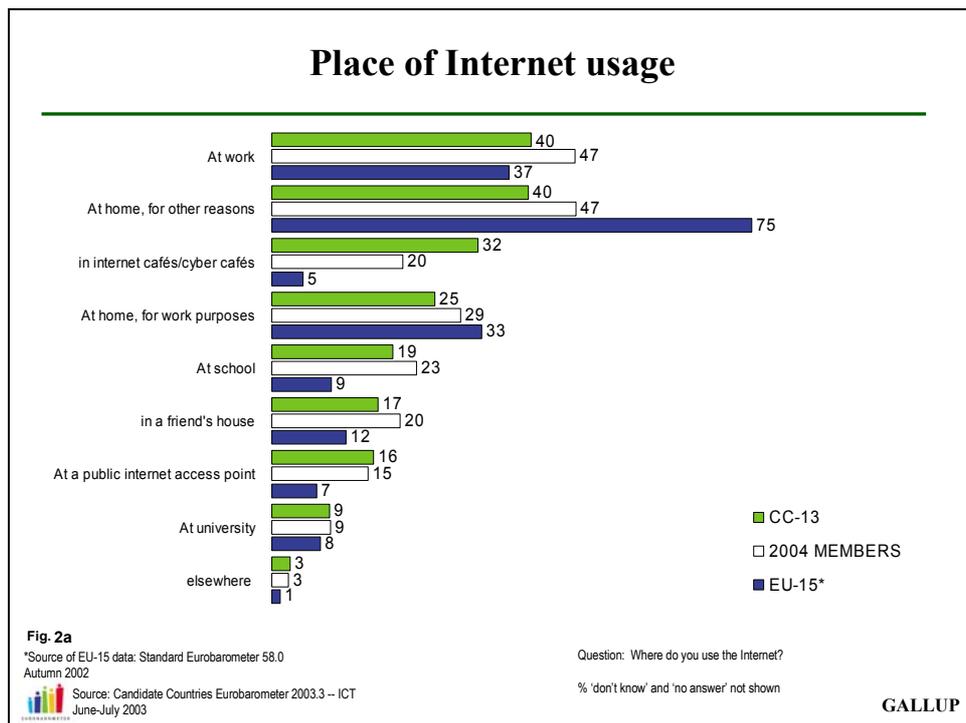

Home Internet usage in EU-15 countries is quite different from Internet usage patterns elsewhere. Of those who use the Internet in EU-15 countries, 75% use the Internet at home. The proportion is 47% in 2004 member countries and 40% in CC-13 countries. On the other hand, Internet usage patterns at work vary less among the three groups of countries: 47% of Internet users from the 2004 member countries, 40% of those from the CC-13 countries and 37% of those from the EU-15 countries use it at work.

Internet cafés and cyber cafés are also popular among Internet users in CC-13 countries; about one-third of Internet users from these countries use these places for surfing.

Thirty-three percent of Internet users in the EU-15 countries turn on the computer at home and connect to the Internet for work purposes.

School is also a place where the Internet is used, especially in 2004 member countries (23% of Internet users from these countries use the Internet in school). One in five Internet users from 2004 member countries indicates that they use the Internet at a friend's house (20%).

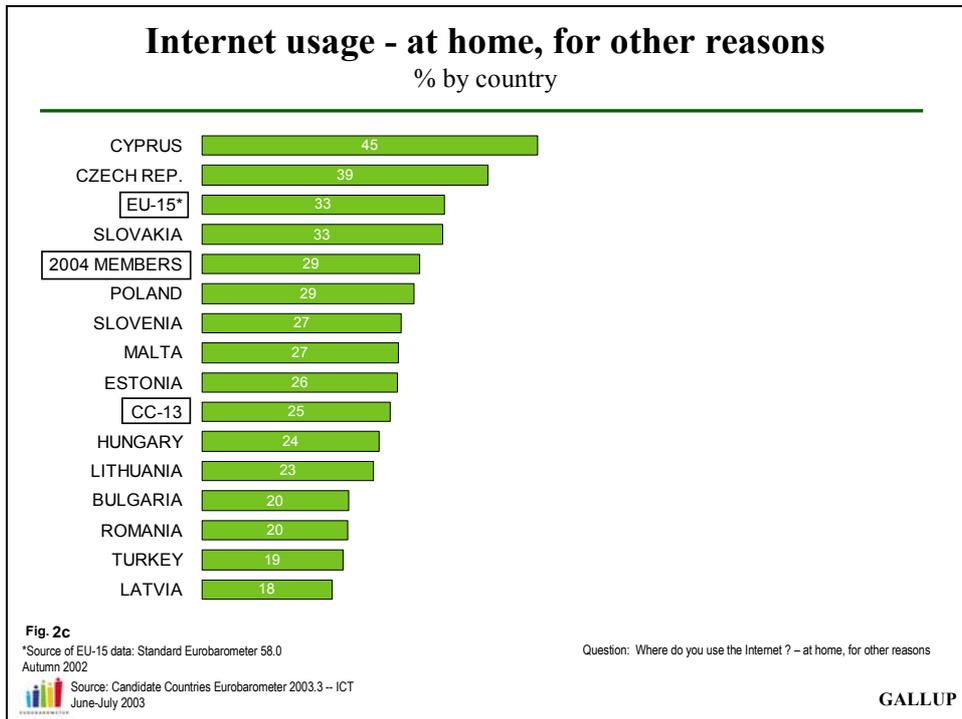

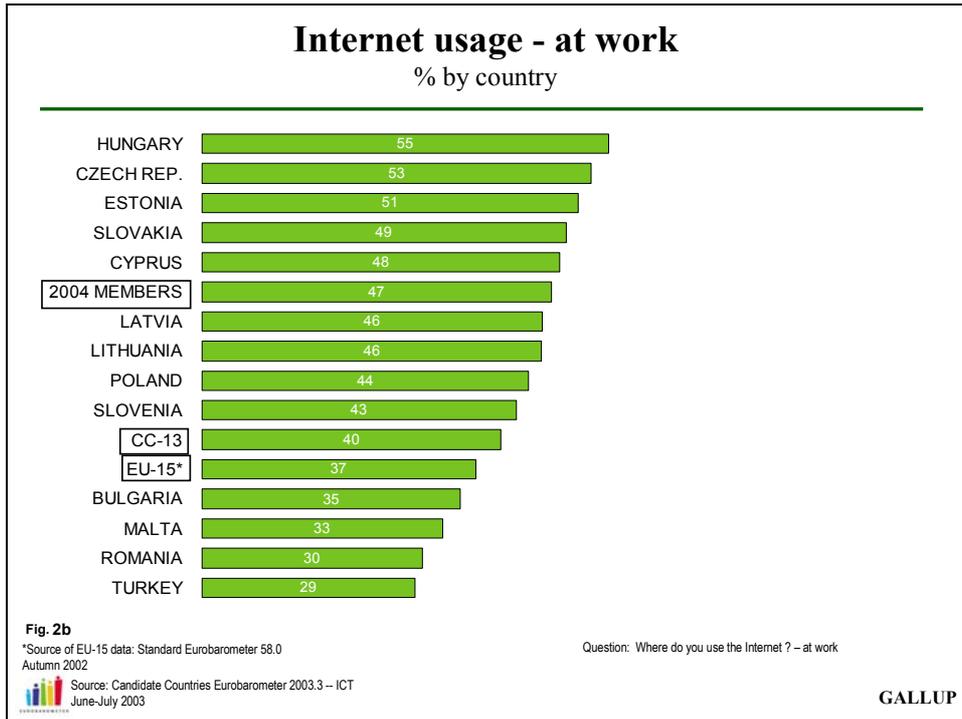

Public Internet access points and universities are not so popular among respondents; 8%-9% of Internet users connect to the Internet at a university, while no more than 16% use the Internet at a public access point. (see ANNEX TABLE 2.1)

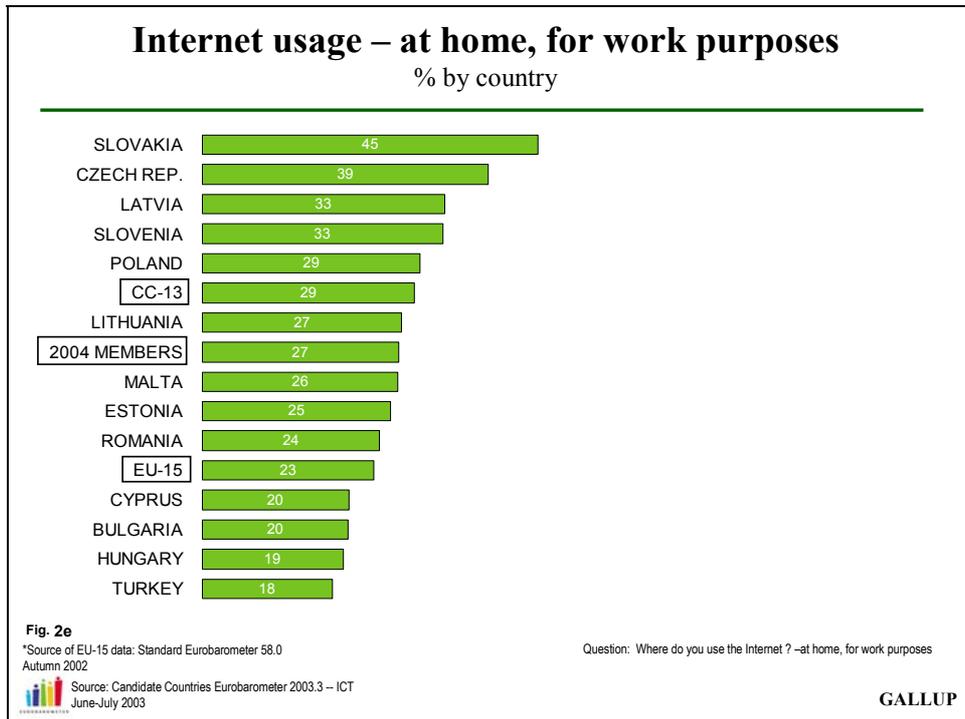

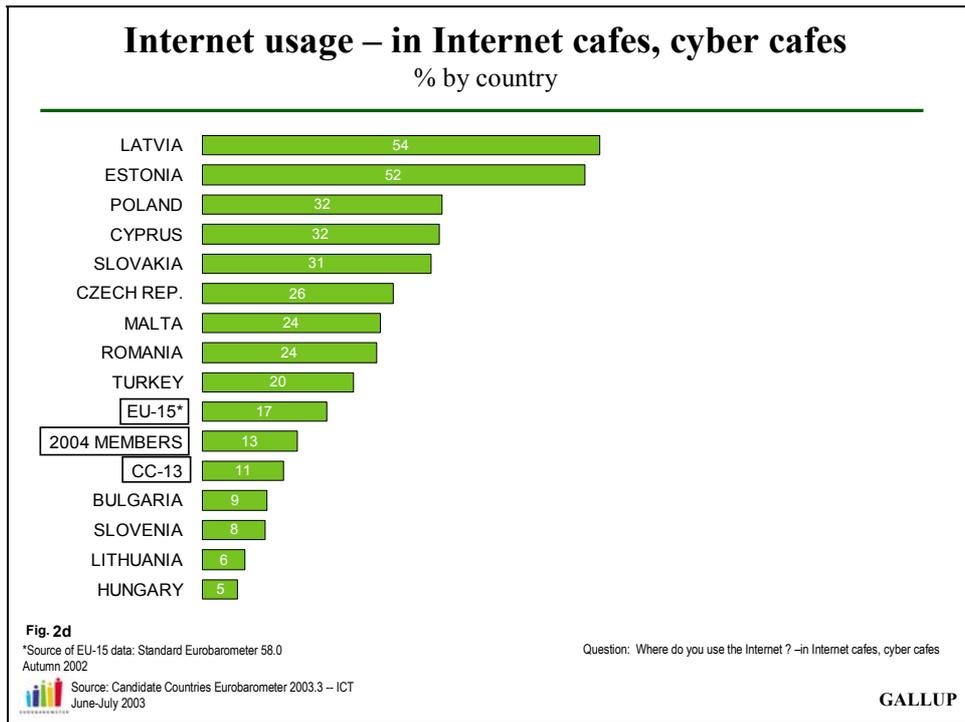

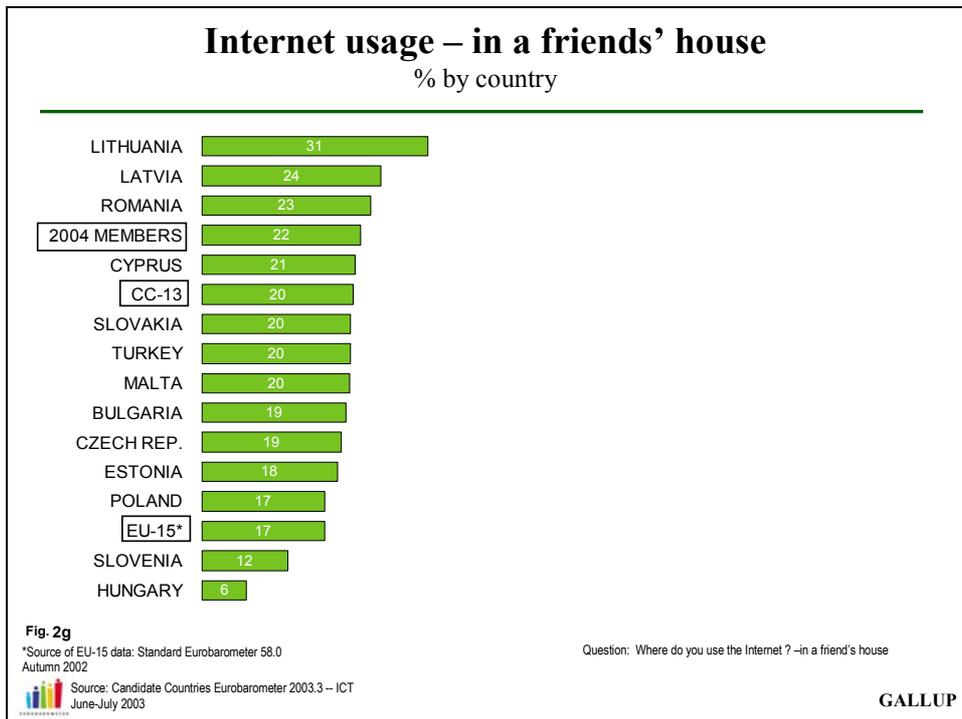

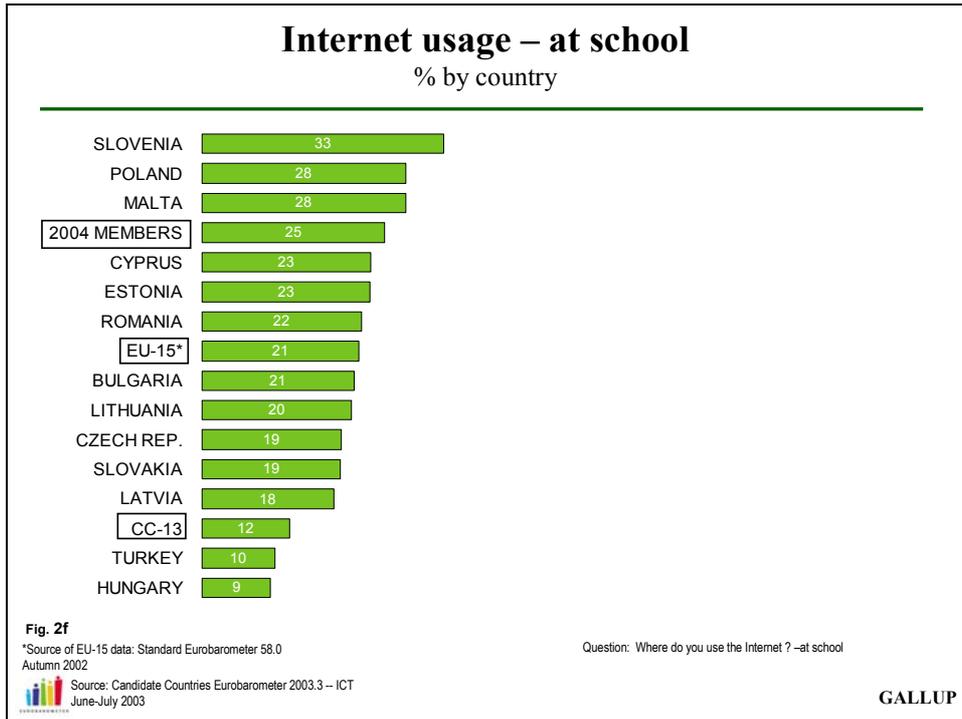

Taking a detailed look at the results by country, we can see that **Internet usage at work** is the most popular in Hungary, with 55% of Internet users indicating they use the Internet there. Czechs (53%) and Estonian (51%) Internet users mention usage at work next most often. Lower proportions of Internet users from CC-13 and EU-15 countries (40% and 37%, respectively) than from 2004 member countries (47%) use the Internet at work. The lowest percentages of Internet users using the Internet at work are the Maltese (33%), the Romanians (30%) and the Turks (29%).

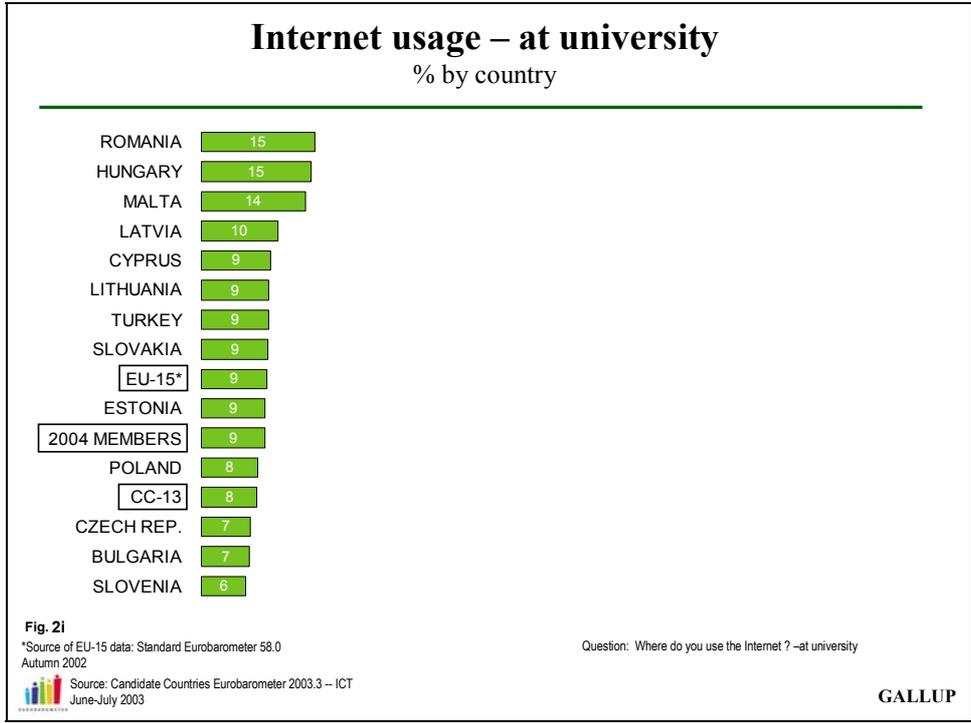

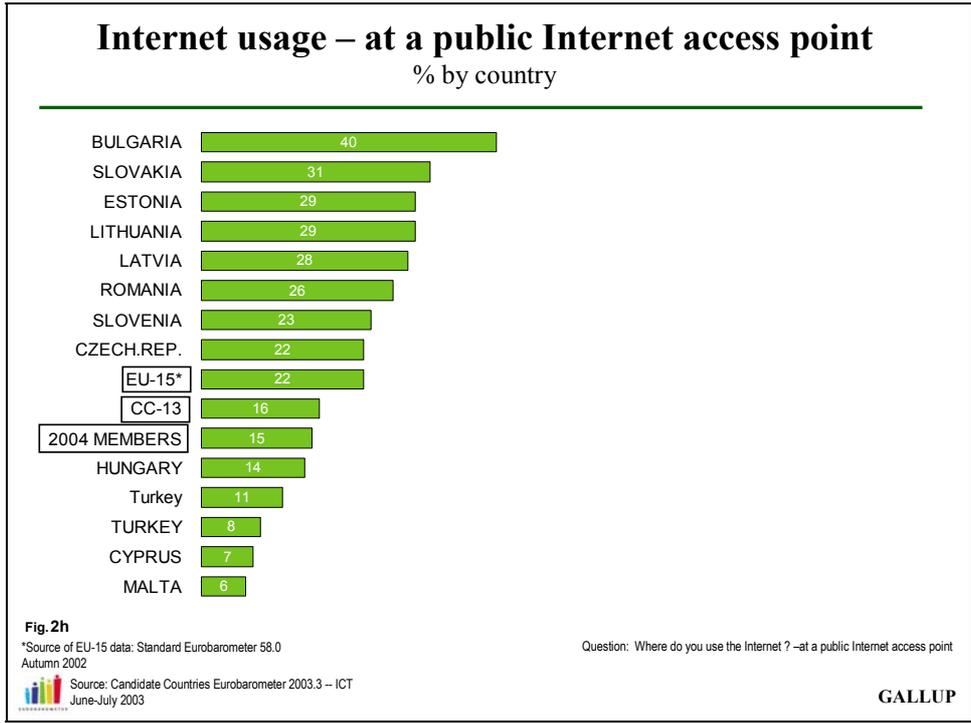

Table 2. Places of Internet usage

In a friend's house	31		
At a public Internet access point	29		

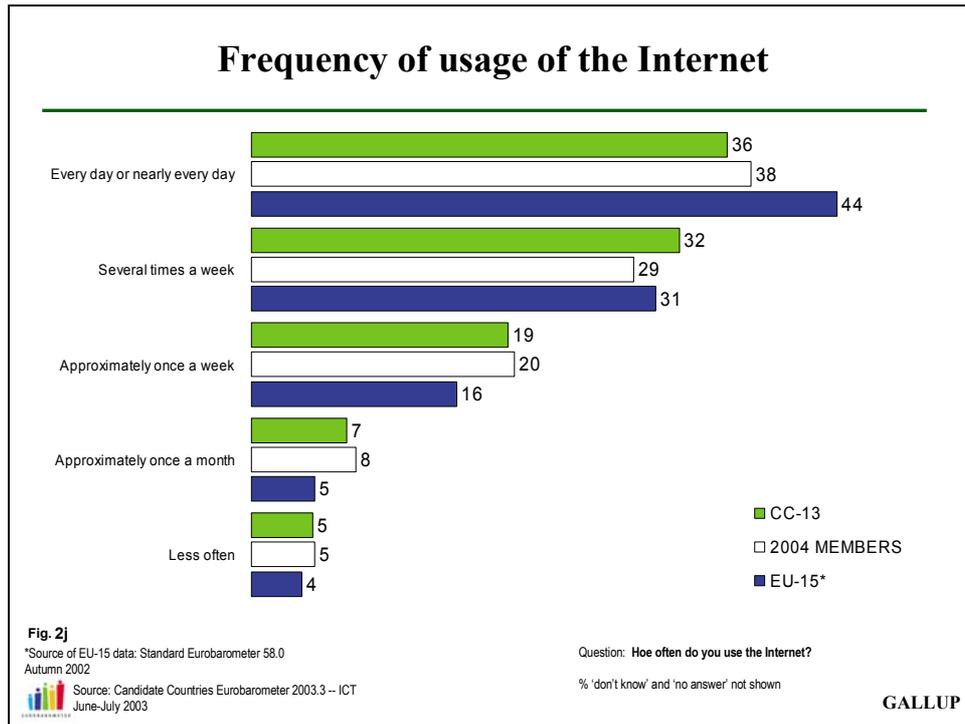

Frequency of using the Internet provides an interesting picture as well. In EU-15 countries, the plurality of Internet users (44%) use the Internet every day or nearly every day. This proportion is somewhat lower in CC-13 countries (36%) and in 2004 member countries (38%). Internet usage “several times a week” is mentioned next most often. Internet users from CC-13 countries give “several times a week” the highest percentage of mentions (32%), followed by those from EU-15 countries (31%) and 2004 members (29%). (see ANNEX TABLE 2.2)

Twenty percent of Internet users from the 2004 member countries use the Internet approximately once a week, as do 19% of CC-13 respondents, while in EU-15 countries, this proportion is only 16%.

“Less often” than once a month is mentioned by the lowest proportion of Internet users -- 5% in both CC-13 countries and 2004 member countries, and 4% in EU-15 countries.

3. Living without Internet

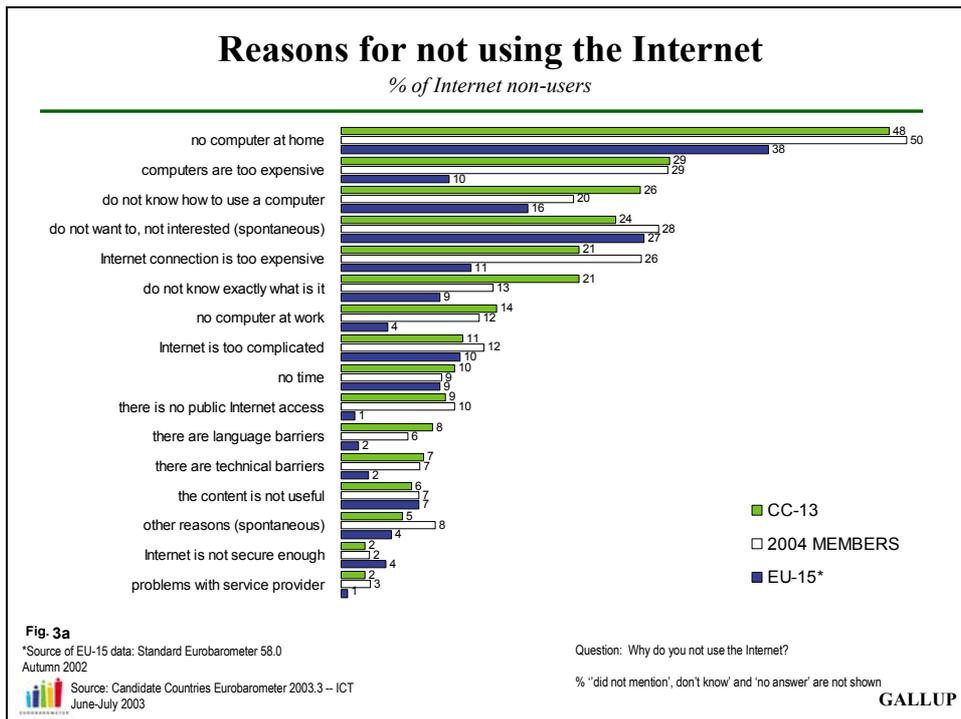

Three-quarters of the population from candidate countries (76%) and almost as many from the 2004 member countries (69%) say they do not use the Internet. This subchapter presents the reasons the candidate countries' population does not use the Internet and what respondents think would encourage their Internet usage.

Why respondents do not use the Internet

The candidate countries' population doesn't use Internet first of all because they don't have a computer at home (48% of those who do not use the Internet give this as a reason). The reason mentioned second most frequently for not using the Internet is that computers are too expensive (29%). The third most frequently mentioned reason people from candidate countries don't use the Internet is because they do not know how to use a computer (26%). The reasons respondents mentioned least frequently are that there are problems with the service provider and that the Internet is not secure enough (2% each).

Looking at the data as to why the 2004 member countries' population does not use the Internet, there is nearly the same ranking of the reasons: those from the 2004 member countries' population who do not use the Internet mention that there is no computer at home (50%), that computers are too expensive (29%), and in third place, we see the spontaneous reason that they do not want to use the Internet -- they are not interested in it (28%). The reason for not using the Internet mentioned by the smallest percentage of the 2004 member countries' population not using the Internet (2%) is that the Internet is not secure enough.

Comparing our measures to the 2002 data from European Union countries, it can be emphasized that virtually all these reasons for not using the Internet are mentioned by lower percentages of people in EU-15 than in CC-13 or in 2004 member countries. However, the ranking of the reasons is not so different: the top reason, similar to that for the other countries, is that respondents who don't use the Internet have no computer at home (38%) The second most frequently mentioned reason is they do not want to use the Internet -- they are not interested in it (27%); and the third most frequently mentioned reason is that they do not know how to use a computer (16%). Reasons mentioned in the lowest percentages by EU-15 respondents who don't use the Internet are that there is no public Internet access and that there are problems with the service provider (1% each). (see also *ANNEX TABLE 3.1*)

Comparing the country-level data, not using the Internet because there is *no computer at home* is mentioned in all candidate countries, and is the most frequently mentioned reason in 10 of them (the lowest rate of mentions in first place is 35% in Romania, and the highest, 58%, is in Estonia).

Respondents mentioned *computers are too expensive* as one of the top three reasons for not using the Internet in 8 of the 13 countries, and in 6 countries this reason is in second place (with the lowest mention, 28%, in Estonia, and the highest, 43%, in Slovakia). In Romania (21%) and in Turkey (32%) this reason is mentioned third most often.

Mentioned as one of the top three reasons for not using the Internet in 7 of the 13 candidate countries is that people *don't know how to use it* – in Turkey this is the reason mentioned second most frequently (35%) and in the other 6 countries, third most (with the lowest rate among these 6 countries, 20%, in Malta 20%, and the highest, 43%, in Slovakia).

In 6 of the 13 candidate countries, one of the top three reasons for non-use of the Internet is that respondents *do not want to use it -- they are not interested in it*. In Cyprus (51%), in Malta (41%), and in Slovenia (28%) this reason receives the most mentions. (ANNEX TABLE 3.1)

Table 3a. Reasons for not using the Internet
(% of mentions given by Internet non-users, by country; top three mentions given)

Bulgaria		Malta	
No computer at home	44	Do not want to, not interested	41
Computers are too expensive	29	No computer at home	32
Do not know how to use a computer	27	Do not know how to use a computer	20

Lithuania			
No computer at home	54		
Computers are too expensive	34		
Do not know how to use a computer	33		

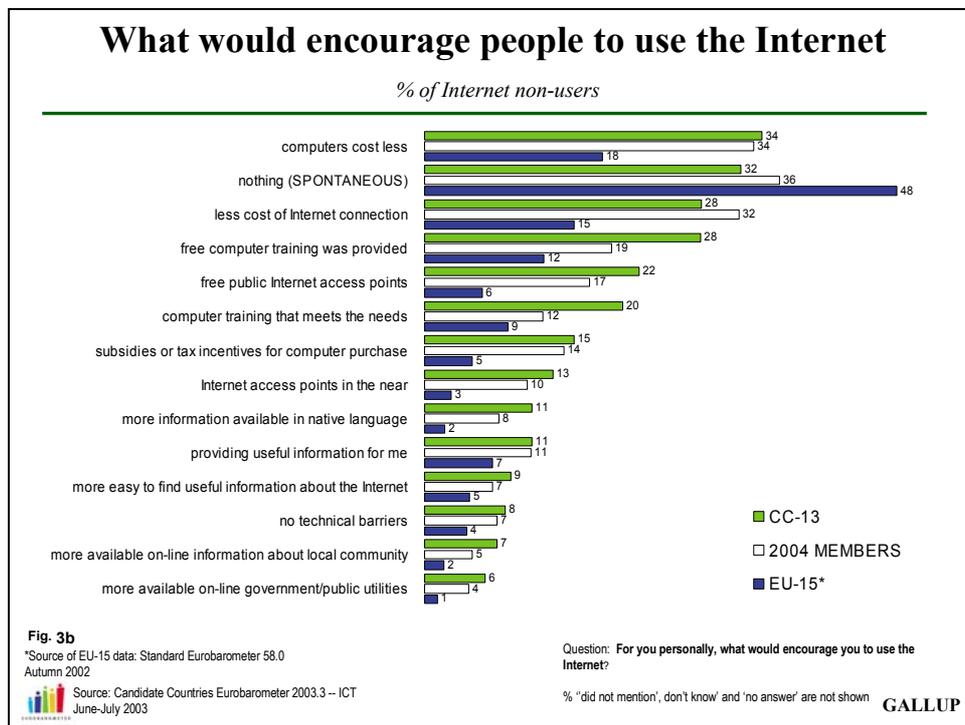

What would encourage the non-users to use the Internet?

If the computers cost less, this could encourage the candidate countries' population to use the Internet; this was the most frequently mentioned answer (34% of those not using the Internet said this). But a rather large proportion of people in these countries (32%) answered that nothing could encourage them to use the Internet. In ranking answers by frequency of mention, the third- and fourth-place answers, according to those from the candidate countries who do not use the Internet, involve lowering the cost of Internet connection and providing free computer training (28% each) as ways to encourage their Internet usage. Having more

government or public utilities available online would encourage the smallest percentage of Internet non-users from the candidate countries' population to use the Internet (6%).

The highest proportion of Internet non-users from 2004 member countries answered that nothing could encourage them to use the Internet (36%). Reducing the cost of computers (34%) or the cost of Internet connection (32%) would encourage about one-third of the 2004 member countries' Internet non-users to use the Internet. However, having more government or public utilities available online would not encourage many to use the Internet (4%).

Comparing the European Union countries' Internet non-users' answers to those from candidate and 2004 member countries (FIGURE 1.3b), we find the same top three answers, but with rather different percentages. Nothing could encourage almost half of European Union Internet non-users to use the Internet (48%) -- this is the opinion held by largest proportion of this group. But about one in six mention that if either the computer (18%) or the Internet connection (15%) cost less, these could give them an impetus toward Internet usage. (see also ANNEX TABLE 3.2)

Analysing the country-by country data, we emphasize that if the computers would cost less, Internet non-users in 12 of 13 countries say (as one of their top three answers) this would encourage them to use the Internet. In Estonia (38%), in Lithuania (39%) and in Poland (38%) this answer is mentioned most often.

Except for Lithuania and Turkey, each candidate country's Internet non-users spontaneously mention that nothing would encourage them to use the Internet as one of their top three answers. This is the first-place response in eight countries (with the lowest rate among these eight, 30%, found in Romania and the highest, 64% each, found in Cyprus and Malta).

Less cost of Internet connection would also encourage the Internet non-users in 7 of the 13 candidate countries; this answer is the first-place answer in Slovakia (41%). The provision of free computer training is mentioned as one of the top three in seven candidate countries. For more detailed data, see the table below and the ANNEX TABLE 3.2.

Table 3b. What would encourage respondents to use the Internet
(% of mentions among those who do not use the Internet, by country;
top three mentions given)

4. Expected changes in daily life using the Internet

As FIGURE 1.4a shows below, most of the Internet non-users from candidate countries, as well as those from 2004 member countries and European Union countries, mention spontaneously that the Internet would not change their daily lives (35%, 39%, and 43%, respectively). It is interesting to note that the European Union population mentioned this at a higher rate than did the CC-13 or 2004 member countries' populations.

Thirty-two percent of the candidate countries' Internet non-user population, 28% of the 2004 member countries' population, and, with the lowest rate, 14% of the European Union countries' population (the second-place response for all of them) mention that if they would use the Internet, they would be better informed about the relevant issues of daily life.

In third place for all three groups (tied for third with "would spend more money" for EU-15 respondents) is the answer that Internet users would have more contacts with people. This is the opinion of 30% of the population from the candidate countries, 25% of those from the 2004 member countries and 11% from the European Union countries.

Only 1% each of the population from the CC-13, 2004 member and European Union countries answered that if they would use the Internet, it would be more difficult to use public services. For more detailed data, see also ANNEX TABLE 4.

As TABLE 4 shows below, in each of the candidate countries, the answer that the Internet would not change the daily life of the population appears as one of the top three given. In nine countries, this answer is mentioned most frequently of all (with the lowest rate among the nine in Romania, at 30%, and the highest in Cyprus, at 61%).

Each of the candidate countries' respondents say they would be better informed about the relevant issues of daily life if they would use the Internet. This possibility is mentioned as one of the top three in each country, and in Lithuania (38%), Slovakia (38%) and Turkey (42%) it is the first-place answer.

Except in the Czech Republic and Lithuania, each of the candidate countries' Internet non-users mention as one of the top three answers that if they would use the Internet, they would have *more contacts with people*. In Bulgaria, this is the most frequently mentioned answer (29%). For more information, see *TABLE 4* below (and *ANNEX TABLE 4* for more detailed figures)

Table 4. The way the Internet would change daily life

Would feel more included in society	23		

5. Main purposes of Internet usage

This chapter encompasses main areas of Internet usage, reasons for using the Internet and different kinds of computer training.

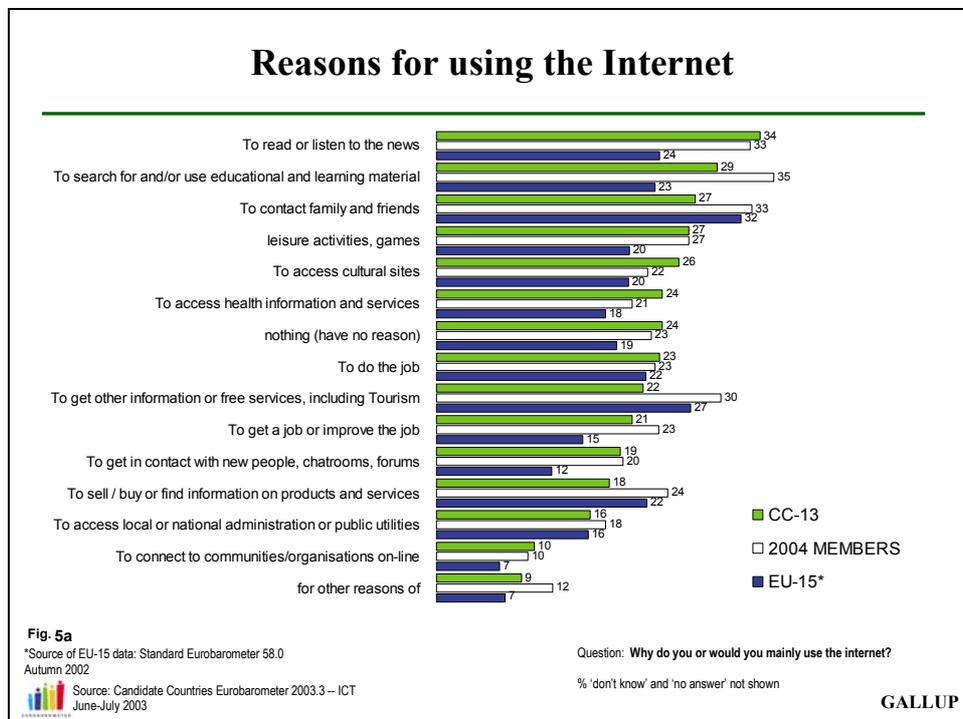

People were interviewed about their reasons for using the Internet. In many cases, respondents connect to the Net to read or listen to the news. Thirty-four percent of Internet users from the CC-13 countries mention this as a reason to get online, making it the most frequently mentioned reason. This proportion is slightly lower in 2004 member countries (33%) and is somewhat lower in EU-15 countries (24%).

In the CC-13 countries, 29% of Internet users use the Internet to search for educational or learning material, compared to 35% in 2004 member countries and 23% in EU-15 countries.

Internet users from 2004 member countries connect to the Internet in the highest proportion (35%) to search for and/or use educational and learning material, followed by connection to contact family and friends, and to read or listen to news (33% each).

Respondents are also interested in cultural sites and health information available on the Internet, which are the fifth- and sixth- most popular answer for the three groups of countries. Cultural sites are mentioned by the highest percentage in CC-13 countries (26%), as is accessing health information and services (24%).

Getting other information or free services, including tourism, from the Internet is frequently mentioned among respondents from 2004 member countries (30%); in the CC-13 countries, this percentage is 22%.

Fewer respondents mention searching for a job or improving one's job: 21% of respondents in the CC-13 countries, 23% in the 2004 members countries and 15% in the EU-15 countries connect to the Internet for this reason.

Chat rooms, forums and contacting new people on the Internet are even less popular, with 12% of the EU-15 countries using the Internet for this purpose. A higher proportion of 2004 member countries' respondents chat and get in touch with other people on the Internet (20%).

Connecting for communities and organizations online is the least popular specific reason for using the Internet. Ten percent of those from the CC-13 and 2004 member countries mention it, versus 7% of those from the EU-15 countries. (see *ANNEX TABLE 5*)

Taking a closer look at the individual country results, it is clear Turks are more likely than any respondents from other CC-13 countries to use the Internet **to do the job** (31%). Cypriots (29%) and Lithuanians (27%) mention this reason next most often. The Maltese (14%) and Romanians (8%) connect to the Net "to do the job" in the lowest proportions. (*FIGURES 5b-5n.*)

On the other hand, **to get a job or improve the job** is mentioned most frequently as a reason for connecting to the Net in Slovakia (30%) and in Poland (26%). In 2004 member countries overall, 23% use the Internet for this purpose, and in the CC-13 countries, 21% do. Slovenians (15%) and Maltese (11%) mention this reason least frequently.

Poles (42%), and Maltese (32%) use the Internet to **search for educational material** in highest proportions. The overall percentage for the 2004 member countries is 35%. In EU-15 countries, this reason for using the Internet is not as popular (23%); the Romanians use the Internet least for this purpose (20%).

Using the Internet as an option **to sell or buy products** or to receive information on products is most popular in the Czech Republic, as 33% of the Czechs use the Internet for this purpose. Slovenian (28%) and Polish (26%) respondents are in second and third place, respectively, on this measure. Low proportions of Turks (12%) and Cypriots (12%) use the Internet for this reason. Overall, this use of the Internet is somewhat popular in CC-13 countries (18%) and in EU-15 countries (22%).

Getting information or free services, including tourism, on the Internet is most popular in the Czech Republic (41%), and a large percentage of Slovaks also use the Net to do this (38%). Overall, about 3 in 10 from 2004 member countries (30%) and EU-15 countries (27%) connect to the Internet for this purpose. Cypriots and Turks do not often access the Internet to get information or free services: only 17% of Cypriots and 13% of Turks say they do this.

Estonians (41%) and Turks (40%) **read or listen to news** on the Internet in the highest proportions, in contrast to the Maltese (23%) and the Cypriots (23%).

Of those who connect to the Internet **to access cultural sites**, Turks and Hungarians are most likely to do so (34% and 30%, respectively). Slovenians and Cypriots are least likely to give this as a reason for using the Net (14% and 11%, respectively).

Czechs (32%) and Slovaks (26%) connect to the Internet in the highest proportions **to access local or national administration or public utilities**, even though this kind of information search is not the favoured one. Altogether, 9% of Romanians and 7% of Cypriots surf the Net to find this kind of information.

For accessing health information and services, the proportions mentioning this as a reason to use the Internet are similarly low. Turks mention it most frequently (31%), followed by Slovaks and Czechs (25% each). Overall, the CC-13 countries as a group come in fourth place (24%). This reason is mentioned least frequently in Romania (17%), Hungary (17%) and Cyprus (15%).

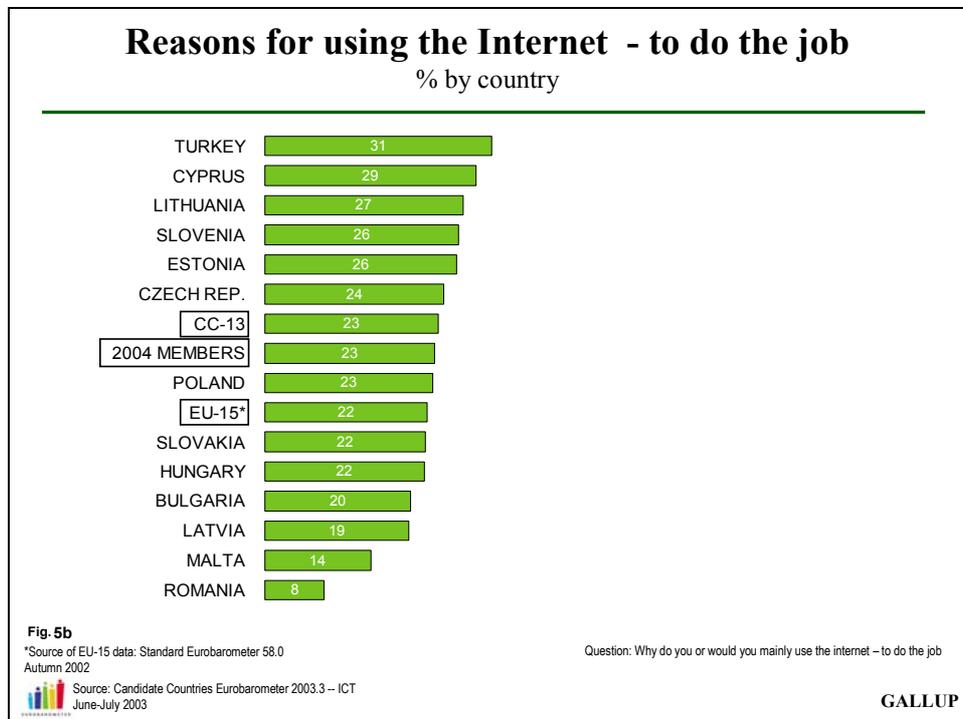

Contacting family members and friends on the Internet is popular in Slovakia (38%) and in Poland (36%); these countries mention it in the highest proportions. In 2004 member countries, this proportion is 33%, while in EU-15 countries, 32% of respondents mention it as a reason to connect to the Internet.

Romanians and Cypriots are least likely to use the Net to get in touch with family and friends -- 20% of the Romanians and 16% of the Cypriots mention it.

To get in contact with new people is another way to use the Net. Bulgarians (25%) and Poles (22%) are most likely to connect to the Net for chat rooms, forums and contacting new people. In the EU-15 countries and in Cyprus, only 12% use the Internet for this purpose.

Using the Internet for **leisure activities and games** is widespread in Lithuania (37%) and in Slovakia and the Czech Republic (30% each). Twenty-seven percent of respondents in both 2004 member countries and CC-13 countries mention this option as a reason to connect to the Internet. Romanians (20%) and Maltese (19%) are least likely to mention this reason.

The least popular specific reason to use the Internet is **connecting to communities or organizations**. The respondents most likely to mention this are the Maltese and the Turks – still, only 14% and 13%, respectively, do so. Only 10% of respondents from both the CC-13 countries and 2004 member countries, and just 7% of those from the EU-15 countries give this as a reason for using the Internet.

GALLUP

6. Computer training

Almost half of the respondents in Lithuania (46%) have participated in computer training. Estonians (42%) and Slovenians (38%) are next most likely to have had training. The Turkish and Romanian respondents are least likely to have had any kind of computer training: 16% and 14%, respectively, say they have had such training. (see ANNEX TABLE 6.1)

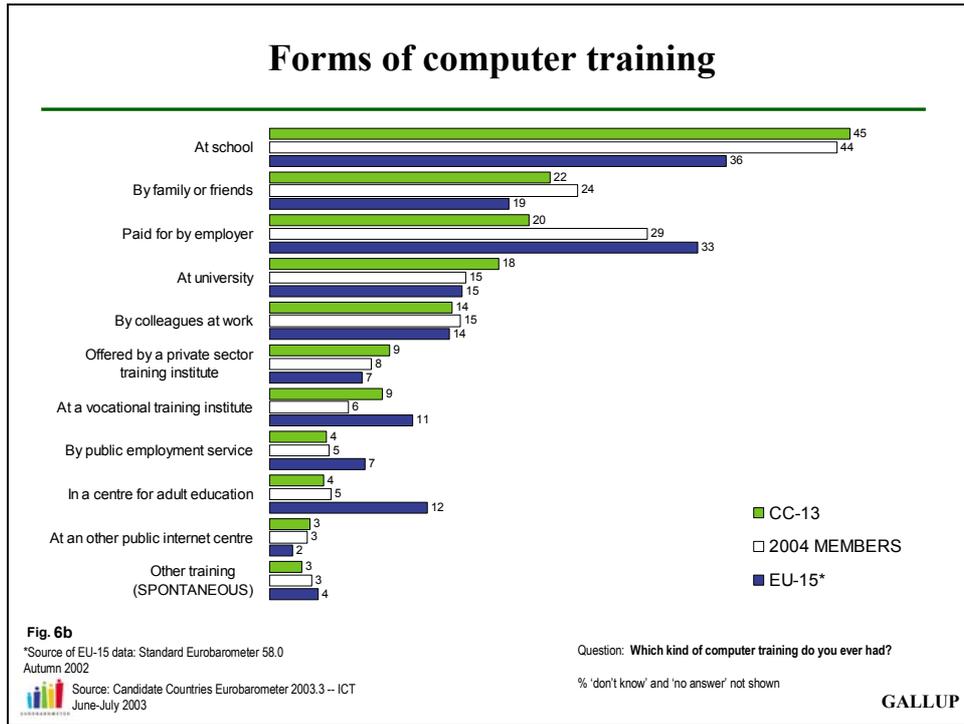

School is mentioned most frequently as the source of the computer training, in all three groups of countries: CC-13 countries (45%), 2004 member countries (44%), and (though the frequency of mention is a bit lower) EU-15 countries (36%).

Computer training given by **family or friends** is the second most widespread source of computer training in the CC-13 countries (22%). Twenty-four percent of those in the 2004 member countries mention it.

Employer-paid computer training is quite popular in EU-15 countries, where 33% of respondents mention it, compared to the CC-13 countries, where this percentage is 20%, and the 2004 member countries, where it is 29%.

Universities also take part in training, but this option is used in somewhat lower proportions. Eighteen percent of the CC-13 countries' respondents and 15% of both 2004 member countries and EU-15 countries say this was a source of their computer training.

There is an interesting difference among the results regarding **centres for adult education**. While 12% of the EU-15 countries mention it as a computer-training source, altogether only 4% of those from CC-13 countries and 5% from 2004 member countries mention it.

Taking a detailed look at the individual country results, respondents from Slovenia (55%), Latvia and Hungary (50% each) are most likely to mention **school** as a source of computer training. Nearly the same percentage of respondents from CC-13 countries and 2004 member countries mention school (45% and 44%, respectively), compared to those from EU-15 countries, who do so in somewhat lower proportions (36%). (the country ranking of forms of training are presented on FIGURES 6c-6l)

Turkey and Romania are countries where schools are mentioned least frequently as computer training sources.

Universities as sources of computer training are most popular in Bulgaria (27%) and Romania (23%). In 2004 member countries and EU-15 countries, these institutions are not among the most popular computer training sources; altogether, 15% of the respondents in these countries mention them.

Computer training **paid for by one's employer** was mentioned in the highest proportion by Slovaks (42%). Czech (38%) and EU-15 respondents (33%) mention employer-paid training next most often. Turkish respondents mention it least often (3%).

As a way to learn the computer, **public employment service** is a rather unused source. Cypriots have the highest percentage of mentions, with only 9%. EU-15 countries have the next highest percentage, with 7%. There are three countries in last place: Bulgaria, Romania and Poland (3% each).

Vocational training institutes as a source of computer training are somewhat popular among Cypriots, who are most likely to have used them (20%). Romanians (15%) and Turks (14%) are next most likely to have used these training institutes for computer training. In EU-15 countries, 11% have used them, while in CC-13 countries, a smaller percentage have used them (7%).

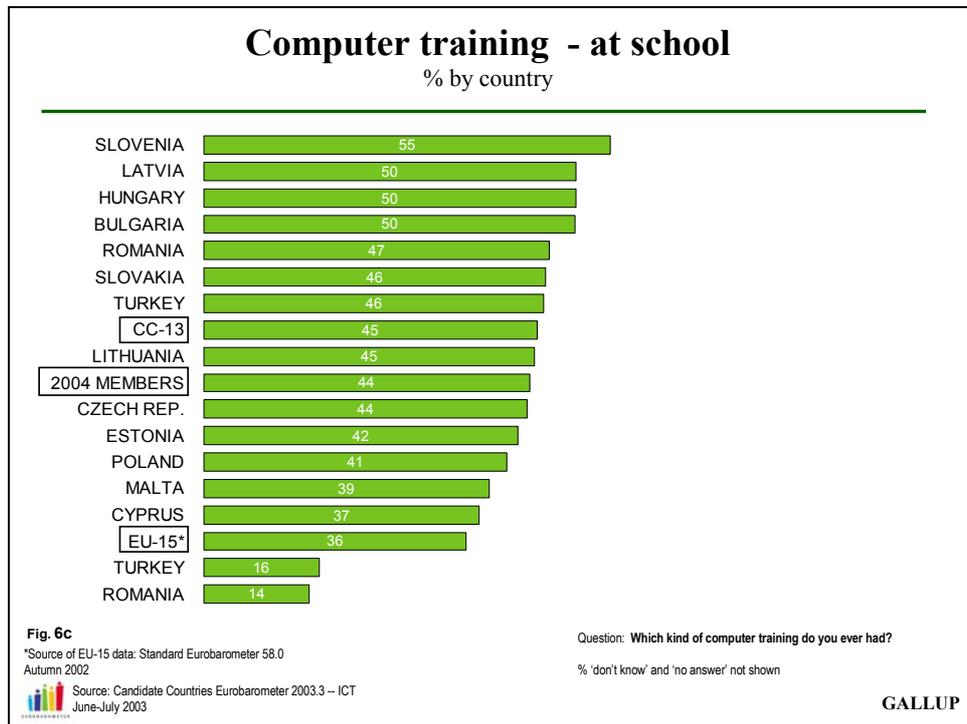

In Estonia, 17% of respondents mention **centre for adult education** as a source of computer training. Respondents from EU-15 countries (12%), Bulgaria and Latvia (9% each) are the next most likely to have had computer training in these centres. At the other end of the spectrum, 2% of both Romanians and Slovenians mention them as a training source.

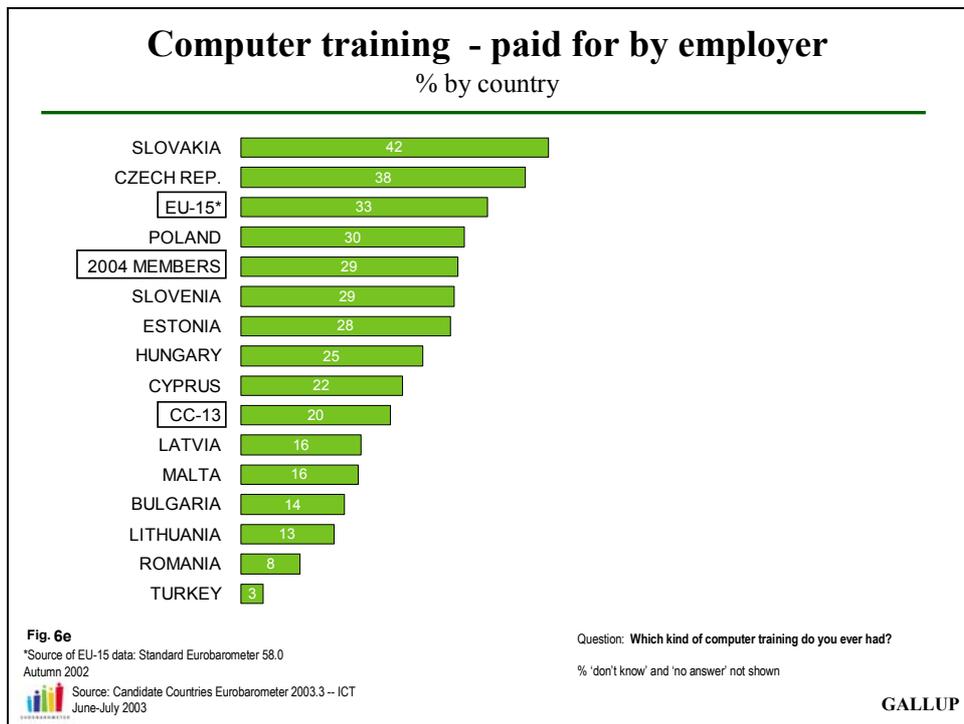

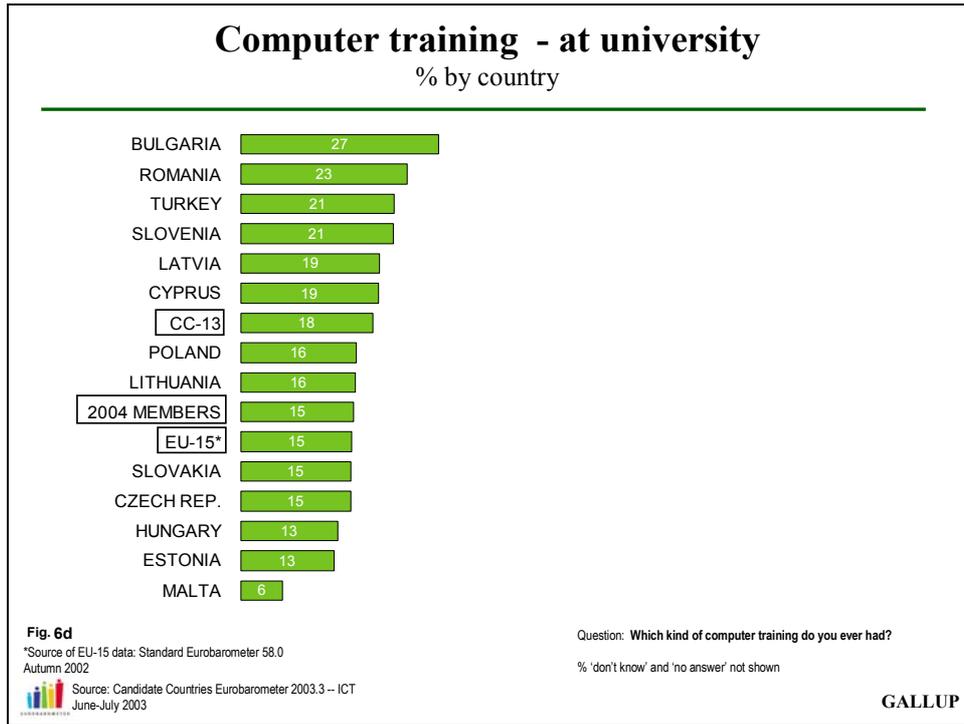

It is interesting to see that **public Internet centres** are not so popular. Bulgarians mention them most frequently; still, only 9% of Bulgarian respondents say they have received computer training there. Three percent of the respondents in CC-13 countries and 2004 member countries mention these centres, and Turks (1%) and Maltese (1%) are least likely to mention having received training there.

Private-sector training institutes are far more popular in Malta than in other countries. Twenty-seven percent of the Maltese mention them, with Turks – the second-place country in terms of mentions – far behind, at 15%. Slovenia (4%) and Bulgaria (3%) are least likely to mention private-sector institutes; in these countries, this source of computer training is not as popular.

Family or friends are very popular sources of computer training in Lithuania; 52% of respondents there mention friends or family as a training source. The second-place country, in terms of mentions, is the Czech Republic, but it trails Lithuania by a wide margin, with only 35% of mentions. In 2004 member countries (24%) and in CC-13 countries (22%) overall, this kind of opportunity is less popular. Turks and Cypriots mention it in the lowest proportions (Turks, 15%; Cypriots, 13%).

Twenty-nine percent of Czechs say they have received computer training from **colleagues at the workplace**; Lithuanians (27%) and Slovenians (20%) give this answer next most frequently. In 2004 member countries, 15% of the respondents mention workplace colleagues as a computer training source, as do 14% of both CC-13 and EU-15 respondents. Cypriots and Poles do not use this training option frequently; only 7% in both countries mention it. (see ANNEX TABLE 6.2)

7. Telework

Finally, our questionnaire explored basic attitudes regarding telework, that is, working from distance or from home, with applying various tools of information and communication technology.

Only 8% of the candidate countries' population regularly or occasionally teleworks, and only 3% telework regularly. Almost three-quarters of the population from CC-13 countries doesn't currently telework, but 22% of all respondents say they would be interested in doing so. Half of the CC-13 population is not interested in this way of working (50%).

Looking at respondents from the Laeken countries, 12% of them telework, with 5% doing so regularly. As in the CC-13 countries, nearly three-quarters of people from 2004 member countries indicate that they don't telework. One-quarter of the 2004 member countries' population is interested in teleworking (24%), but 49% are not interested.

As individual country-level analysis shows, the highest percentage of Maltese (23%), Slovenians (22%) and Hungarians (20%) telework either regularly or occasionally, and the highest percentages of regular teleworkers are in Malta (11%) and Hungary (10%).

The lowest percentage of regular or occasional teleworkers is found in Turkey (3%). The Bulgarians, Lithuanians and Turkish have the smallest percentages of regular teleworkers (1% each).

Looking at those who do not telework but would be interested in doing so, the Bulgarians (34%), Slovaks (32%) and Latvians (27%) have the highest percentages indicating interest and the Maltese (9%) have the lowest.

Malta (66%), Cyprus (63%) and Turkey (60%) have the highest percentages of respondents who do not telework and are not interested doing so. Lithuanians have the lowest rate of disinterest in telecommuting (27%). (see ANNEX TABLE 7)

C.3 Sample Specifications

Between the 16th of June and the 18th of July 2003, The Gallup Organization Hungary carried out wave 2003.3 of the Candidate Countries Eurobarometer, at the common request of the EUROPEAN COMMISSION, Directorate-Generals Press and Communication and DG ICT and Gender, DG Justice and Home Affairs and DG Health and Consumer Protection.

The Candidate Countries Eurobarometer 2003.3 covers citizens of each of the countries that are applying for European Union membership aged 15 and over, with the exception of Estonia, Latvia and Cyprus. In Estonia and Latvia, the survey covered permanent residents aged 15 and over. In Cyprus, the sample covered the territory of the Republic of Cyprus only. The basic sample design applied in all Candidate Countries is a multi-stage, random (probability) one. In each country, a number of sampling points were drawn with probability proportional to population size (for a total coverage of the country) and to population density.

For doing so, the points were drawn systematically from each of the "administrative regional units", after stratification by individual unit and type of area. They thus represent the whole territory of the Candidate Countries Region according to the EUROSTAT NUTS 2 (or equivalent; if there are no such regions, we used NUTS 3 or equivalent regions for sampling) and according to the distribution of the resident population of the respective nationalities in terms of metropolitan, urban and rural areas. In each of the selected sampling points, a starting address was drawn, at random. Further addresses were selected as every Nth address by standard random route procedures, from the initial address. In each household, the respondent was drawn, at random. All interviews were face-to-face in people's home and in the appropriate national language. In countries with significant minorities the respondents had a chance to respond in their mother tongue (in Estonia, Latvia and Lithuania in Russian, and in Romania in Hungarian).

Countries	Institutes	Number of Interviews	Field Work Dates	Population (x 000)
Bulgaria	VITOSHA RESEARCH	1000	18-June – 2-July	7,891
(Republic of) Cyprus	CYMAR MARKET RESEARCH	500	18-June – 4-July	689
Czech Republic	CVVM	1000	16-June – 6-July	10,226
Estonia	SAAR POLL	1007	19-June – 6-July	1,360
Hungary	THE GALLUP ORGANIZATION, HUNGARY	1003	25-June – 18-July	10,195
Latvia	LATVIAN FACTS LTD.	1004	26-June – 6-July	2,345
Lithuania	BALTIC SURVEYS	1004	18-June – 29-June	3,475
Malta	MISCO	500	16-June – 5-July	386
Poland	THE GALLUP ORGANIZATION, POLAND	1000	16-June – 8-July	38,632
Romania	THE GALLUP ORGANIZATION, ROMANIA	1047	18-June – 2-July	22,435
Slovakia	FOCUS CENTER FOR SOCIAL AND MARKET ANALYSIS	1061	20-June – 7-July	5,331
Slovenia	CATI D.O.O.	1000	18-June – 16-July	1,980
Turkey	KONSENSUS RESEARCH & CONSULTANCY	1000	18-June – 30-June	67,803
Total number of Interviews		12126		172,748

For each country a comparison between the sample and the universe was carried out. The Universe description was derived from population data from national statistics. For all Candidate Countries a weighting procedure, using marginal and intercellular weighting, was carried out, based on this Universe description. As such in all countries, gender, age, region NUTS 2, settlement size, household size, and education level were introduced in the iteration procedure. For international weighting (i.e. CC-13 or MS-2004 averages), Gallup applies the official population figures as provided by national statistics. The total population figures for input in this post-weighting procedure are listed above.

The results of the Candidate Countries Eurobarometer studies are reported in the form of tables, data files and analyses. Per question a Table of results is given with the full question text in English. The results are expressed as a percentage of the total. The results of the Eurobarometer surveys are analysed and made available through the Directorate-General Press and Communication, Opinion Polls of the European Commission, Office: Brey 7/41, B-1049 Brussels. The results are published on the Internet server of the European Commission: http://europa.eu.int/comm/public_opinion/. All Eurobarometer datafiles are stored at the "Zentral Archiv" (Universität Köln, Bachemer Strasse, 40, D-50869 Köln-Lindenthal), available through the CESSDA Database <http://www.nsd.uib.no/cessda/europe.html>. They are at the disposal of all institutes members of the European Consortium for Political Research (Essex), of the Inter-University Consortium for Political and Social Research (Michigan) and of all those interested in social science research.

Readers are reminded that survey results are *estimations*, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits (in case of a sample of 1000 people – confidence intervals for N=500 sample are larger):

Observed percentages	10% or 90%	20% or 80%	30% or 70%	40% or 60%	50%
Confidence intervals	± 1.9%	± 2.5%	± 2.7%	± 3.0%	± 3.2%

C.4 Definition and weighted distribution of the socio-demographic and other variables used in cross-tabulations

C.4.1 Gender

The sample consists of the following breakdown by gender:

(1) Men	48 %
(2) Women	52 %

C.4.2 Age bands

On the basis of their age, respondents are grouped into the following four age bands:

(1) Aged 15 -24	21 %
(2) Aged 25 -39	29 %
(3) Aged 40 -54	25 %
(4) Aged 55+	25 %

C.4.3 Terminal education age

Terminal education age represents recoded categories of answers to the following question :

"How old were you when you stopped full-time education?"

Respondents are grouped into the following 4 categories :

(1) respondents who left school at age fifteen or younger	40 %
(2) respondents who left school at ages 16 to 19	34 %
(3) respondents who stayed in school until they were aged 20 or older	15 %
(4) respondents who are still studying	11 %

C.4.4 Main economic activity scale

The main economic activity scale represents recoded answers to the following question:

"What is your current occupation?"

The original question shows the following distribution:

Self – employed

(1) Farmer	6 %
(2) Fisherman	0 %
(3) Professional (lawyer, medical practitioner, accountant, etc.)	1 %
(4) Owner of a shop, craftsman, self -employed person	6 %
(5) Business proprietor, owner (full or partner) of a company	1 %

Employed

(6) Employed professional (employed doctor, lawyer, practitioner, accountant, architect)	2 %
(7) General management, director or top management (managing director, director general, other director)	1 %
(8) Middle management, other management (department head, junior manager, teacher, technician)	4 %
(9) Employed position, working mainly at a desk	4 %
(10) Employed position, not at a desk but travelling (salesman, driver, etc.)	2 %
(11) Employed position, not at a desk, but in a service job (hospital, restaurant, police, fireman, etc.)	3 %
(12) Supervisor	0 %
(13) Skilled manual worker	8 %
(14) Other (unskilled) manual worker, servant	3 %

Non-active

(15) Responsible for ordinary shopping and looking after the home, or without any current occupation, not working	16 %
(16) Student	11 %
(17) Unemployed or temporarily not working	9 %
(18) Retired or unable to work through illness	23 %

The recoded categories and their distribution for the main economic activity scale are as follows:

(1) Self employed = Farmer + Fisherman + Professional (lawyer, medical practitioner, accountant, architect, etc.) + Owner of a shop, craftsman, other self employed person + Business proprietor, owner (full or partner) of a company	14 %
(2) Managers = Employed professional (employed doctor, lawyer, accountant, architect, etc.) + General management, director or top management (managing director, director general, other director) + Middle management, other management (department head, junior manager, teacher, technician)	7 %
(3) Other white collars = Employed position, working mainly at a desk + Employed position, not at a desk but travelling (salesmen, driver, etc.)	6 %
(4) Manual Workers = Employed position, not at a desk, but in a service job (hospital, restaurant, police, fireman, etc) + Supervisor + Skilled manual worker + Other (unskilled) manual worker, servant	14 %
(5) House persons = Responsible for ordinary shopping and looking after the home, or without any current occupation, not working	16 %
(6) Unemployed = Unemployed + temporarily not working	9 %
(7) Retired = Retired + unable to work through illness	23 %
(8) Still studying = Student	11 %

In the tables, the category "Still studying" is displayed as part of the Terminal Education Age variable

C.4.5 Size of locality

On the basis of their own evaluation, respondents are grouped into the following groups according to the size of their settlement:

(1) rural area or village	40 %
(2) small or middle sized town	32 %
(3) large town	28 %
