

HEALTH CARE SERVICES

IN THE NEW MEMBER STATES AND THE CANDIDATE COUNTRIES

Fieldwork: February-March 2004

Publication: July 2004

This survey was requested by the Directorate General Employment and Social Affairs and coordinated by the Directorate General Press and Communication

This document does not represent the point of view of the European Commission. The interpretations and opinions contained in it are solely those of the authors.

Introduction

The Candidate Countries Eurobarometer (CC-EB) gathers information from the societies that are to become members of the European Union in a way that is fully comparable with the Standard Europarometer. The CC-EB continuously tracks support for EU membership in each country, and records attitudes related to European issues.

This report covers the results of the wave of survey conducted in February-March 2004, in the 13 candidate countries: Bulgaria, Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Romania, Slovakia, Slovenia and Turkey.

An identical set of guestions was asked of representative samples of the population aged 15 years and older in each candidate country. The sample size in Candidate Countries Eurobarometer surveys is at least 1000 people per country, except for Cyprus and Malta, in which the sample size is 500 respondents each. The achieved sample sizes of the 2004.1 wave are:

| Bulgaria | 1000 | Latvia | 1006 | Slovakia | 1053 |
|-----------|------|-----------|------|----------|-------|
| Cyprus | 500 | Lithuania | 1016 | Slovenia | 1014 |
| Czech Rep | 1000 | Malta | 500 | Turkey | 1000 |
| Estonia | 1004 | Poland | 1000 | | |
| Hungary | 1012 | Romania | 1019 | Total | 12124 |

The survey is carried out by national institutes associated with and coordinated by The Gallup Organization. Hungary, in each of the 13 candidate countries. This network of institutes was selected by tender. All institutes are members of the "European Society for Opinion and Marketing Research" (ESOMAR) or comply with its standards.

The figures shown in this report are weighted by sex, age, region, community size, education level and marital status. The figures given for the ten new member states (NMS-10) and the candidate countries (CC-3) separately and are weighted on the basis of the adult population in each country.

Due to the rounding of figures in certain cases, the total percentage in a table does not always add exactly to 100%, but to a number very close to it (e.g., 99% or 101%). When questions allow for several responses, percentages often add to more than 100%. Percentages shown in the graphics may display a difference of one percentage point in comparison to the tables because of the way previously rounded percentages are added.

Types of surveys in the Eurobarometer series

The European Commission (Directorate-General Press and Communication) organizes general public opinion, specific target group, as well as qualitative (group discussion, in-depth interview) surveys in all member states and, occasionally, in third countries. There are four different types of polls available:

- Traditional standard Eurobarometer surveys with reports published twice a year
- Telephone Flash EB, also used for special target group surveys (e.g., Top Decision Makers)
- Qualitative research ("focus groups"; in-depth interviews)
- Candidate Countries Eurobarometer

The face-to-face general public standard Eurobarometer surveys and the EB Applicant Countries surveys, the telephone Flash EB polls and qualitative research serve primarily to carry out surveys for the different Directorates General and comparable special services of the Commission on their behalf and on their account.

| 7.1 People providing care | 34 |
| 7.2 Paying to take care of elderly parents | 36 |
| 7.3 Long-term care services | 40 |
| 8 Financial situation | 45 |

This Candidate Eurobarometer has investigated how citizens evaluate the health services available for them. The survey also asked questions about their opinion and behaviour regarding the care of elderly, handicapped persons. During this study we examined various aspects of life satisfaction among both new EU member countries and candidate countries citizens, comparing the results with those from 2002, where it was available. However the study was carried out in the period before the accession of the 10 new member states took place, in this analysis we refer to this group of countries as "new members".

1. Health care among other problems that face the nations

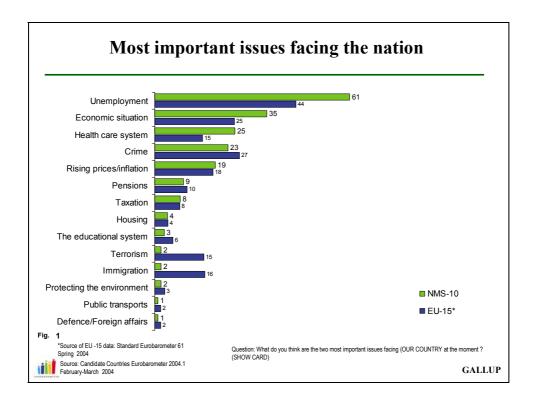

First we look at important issues currently facing European nations. Our respondents were asked to choose, from the following list, the two most pressing issues for their country today:

- Crime
- Public transport
- Economic situation
- Rising prices/inflation
- Taxation
- Unemployment
- Terrorism
- Defence/Foreign affairs
- Housing
- *Immigration*
- Health care system
- The educational system
- Pension
- Protecting the environment

The next graph shows that citizens of new member countries are most likely to feel that unemployment (61%), the economic situation (35%), and the health care system (25%) are the most important problems facing their nation. The citizens of accessing member countries are significantly less likely than the current EU citizens to view terrorism (NMS-10, 2%; EU-15, 15%) and immigration (NMS-10, 2%; EU-15, 16%) as significant problems. On the other hand, the new member states have more problems with unemployment (NMS-10, 61%; EU-15, 44%), and economic situation (NMS-10, 35%; EU-15, 25%).

The citizens of new member states of the EU perceive significantly more problems with their health care system than the current member states do (NMS-10, 25%; EU-15, 15%).

The new citizens of the European Union are not likely to consider terrorism (2%), protecting the environment (2%), immigration (2%), public transport (1%), or defence and foreign affairs (under 1%) to be significant problems.

The most important problems facing the three candidate countries (Bulgaria, Romania, Turkey) are the same as those facing the new members: unemployment (60%), the economic situation (46%), and inflation (22%).

For the candidate countries, the health care system is considered the fifth greatest problem today, with 13% registering their concern for this matter. *TABLE 1* on the next page shows the three most important problems facing each surveyed country. The **health care** made the top three priorities only in Hungary, Poland and Slovakia, coming in third in each of these countries.

Unemployment tops the list of pressing issues in ten of the 13 countries, comes in second in one, and third in another. Cyprus is the only country in which **unemployment** is not one of the top three citizen concerns.

The **economic situation** is one of the top three concerns in 12 countries; only in Estonia is this not among the top three. Concern for the economic situation tops the list in two of the 13 countries (Hungary and Romania), comes in second place in five countries, and third in another five.

Crime is within the top three concerns in six of the 13 countries, and in Cyprus crime is perceived as the most significant problem. Also among the top three most pressing problems we found rising prices/**inflation** (in six countries) and the **health care** system (as mentioned above, in three countries). None of the other problem choices were among the top three most significant national problems for any individual country. (see also *ANNEX TABLE 1*)

27

Economic situation

Here we will look at the five most important problems by country.

- The Polish and Turkish are most worried about unemployment (both 72%), and Cypriots are least worried about this (14%).
- Respondents in Turkey (49%) and Hungary (44%) are the most anxious about the economic situation, which is the second most important concern for 13 other countries. However, the Estonian people report the least economic concerns (24%).
- Inflation is most troubling in Cyprus (41%), while in Bulgaria only 8% believe that inflation is one of the most important problems facing the country.
- In addition to inflation, Cypriots are more worried about crime (51%) than are those in other countries, while Turkey registers the least concern (9%).
- The condition of the **health care** system gives the greatest cause for alarm in Hungary (30%), while it is the least strident issue in Cyprus (7%).

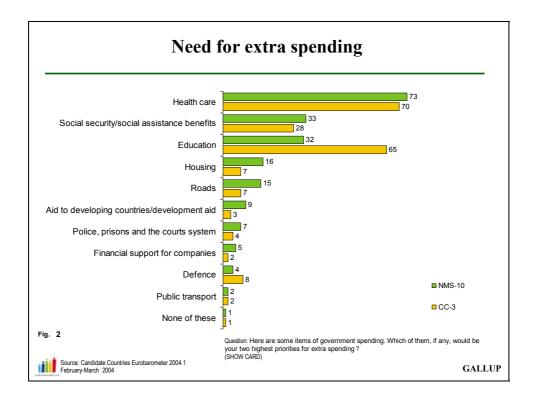

On overage, since Autumn 2003, there has been insignificant change in the new member countries' perceptions of pressing national concerns. In these new members concern for the problem of crime has decreased by 6 percentage points, while concern for the economic situation, health care system and unemployment has increased 3 percentage points, and concern for rising prices and inflation increased as well, by 4 points.

2. Priorities for extra spending

We asked respondents to select two choices from a list of ten budget items for which they believe current government spending levels should increase.

In both the new members and candidate countries most respondents feel that foremost the budget for health care should be increased: 73% of the new EU member countries and 70% of the candidate countries share this view. Second and third to healthcare, 33% of new members believe spending should be increased for social security / social assistance benefits, and 32% ask for more funds to be spent on education.

However, for the three candidate countries not yet joining the Union, increased spending for education (65%) is nearly as desirable as is increased spending on healthcare (70%). In these three countries only 28% reported wanting to increase spending for social security / social assistance benefits.

Several other budgetary concerns were selected by smaller percentages of 2004 members for increased spending: housing (16%), roads (15%), development aid (9%), police, prisons and the courts system (7%), and financial support for companies (5%), (see also ANNEX TABLE 2a)

Table 2. Top three priorities for extra spending (%, by country)

| | Malta | |
|----|--|--|
| 72 | Health care | 63 |
| 47 | Social security/social assistance benefits | 38 |

Health care was considered the most important area for increased spending in twelve of the thirteen surveyed countries. A full 60-78% of the surveyed population was of this opinion. The single exception was Turkey, where education was considered a good candidate for increased spending by more respondents (82%) than was health care. Still, 70% of Turks would like to increase spending on health care.

Women were more likely to choose health care as a priority for increased spending than were men: 68% of men and 74% of women selected health care among the first two priorities for spending increases.

As age increases so does one's desire for the government to spend more on healthcare. Among those younger than 25 years, 62% selected healthcare as on of the two areas that should receive more government spending. At the same time, 72% between the ages of 25 and 54, and 77% of those over the age of 55 years feel likewise.

Similarly, the retired population is more likely to support increased spending on healthcare (78%) than those who are not retired.

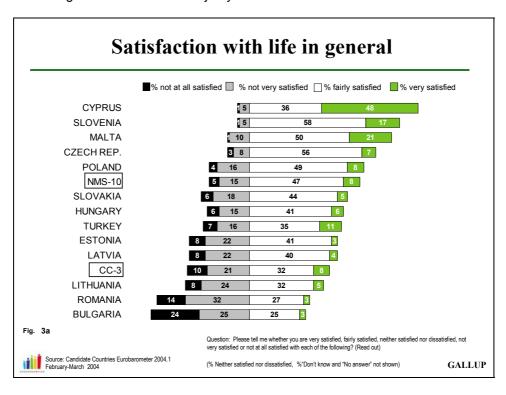

Yet support for increased spending on healthcare is inversely related to the time one spends in education. Two-thirds (74%) of those who finished education at or before the age of 15 regard health care as one of the two most important areas for increased spending, while only 72% of those with education over the age of 15 and 69% of graduates share this view. (ANNEX TABLE 2b)

3. Satisfaction with the health care system

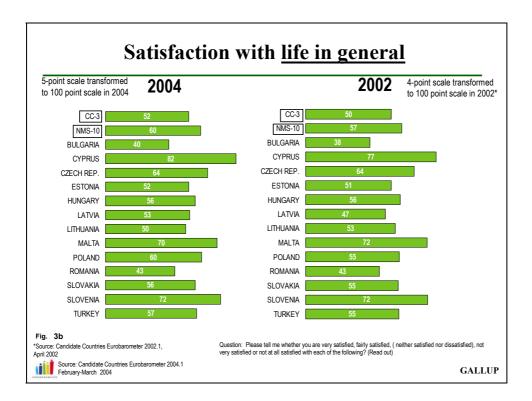

Only 8% of the new EU member countries are very satisfied with their life in general, while 47% are fairly satisfied. Altogether, therefore, the absolute majority of the population feels fairly or very satisfied (55%). At the same time, in the three candidate countries only 40% were thus satisfied with life in general (within that 8% very satisfied).

The most outstandingly satisfied with life are the Cypriots, of whom almost half (48%) are very satisfied with life in general, and another 36% are fairly satisfied. Slovenians and Maltese proved to be fairly satisfied as well. Considering both very and fairly satisfied responses, we find a full 84% in Cyprus, 75% in Slovenia, and 71% in Malta are satisfied with life. The percentage of those not satisfied with their life in general reached only 6% in both Cyprus and Slovenia, and 11% in Malta. (ANNEX TABLE 3.1a)

At the other extreme, respondents dissatisfied with life in general constitute an absolute majority in two of the three candidate countries. In Romania only 30% are satisfied with life in general (within that 3% very satisfied), while 46% are dissatisfied (14% not at all satisfied). The numbers are even worse in Bulgaria, where only 28% of the population is satisfied with life in general (3% very satisfied), and 49% are not satisfied (24% not at all satisfied). The population of these two countries, in the light of our survey, seem to be especially dissatisfied, frustrated and unhappy. In all other countries those who are satisfied with life in general constitute a majority over those not satisfied.

A similar question was asked in 2002. However, in the previous question responses were given on a 4-point scale, while the present survey offered a middle value ("Neither satisfied nor dissatisfied"). Therefore, (limited) comparability was provided for by transforming both scales to a 100-point scale.

After this transformation we can see that, compared to the situation two years ago, there has not been a significant change among the accession or candidate countries. Satisfaction with life in general in the new EU member countries grew from 57 points to 60 in the last two years, and in the candidate countries from 50 to 52 points, but the change is not significant in either case.

Two years ago, as today, the Cypriots, Maltese and Slovenians were most satisfied with life in general. The Bulgarians and Romanians were, also in 2002 as today, the least satisfied with life in general.

Satisfaction with life in general decreases with the advance of age. While 59% of those younger than the age of 25 are satisfied with life in general, merely half of those 25-39, and only 41-42% of those over the age of 40 years of age are satisfied.

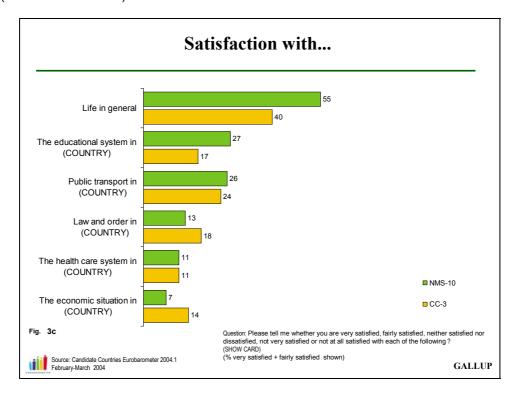

We also find that life satisfaction rises in tandem with one's social status. It is not surprising that the unemployed are the least satisfied with their life: only 31% of the unemployed are "very satisfied" or "fairly satisfied" with life. The story is similar among the retired (37%) while 46% of manual workers. 61% of other white collar workers, and 68% of managers (more than twice the proportion of the unemployed and one and a half times that of the manual workers) are satisfied with life in general.

The same tendency is seen regarding education. Only 38% of the least educated are satisfied with life in general, but 47% of those with secondary education, and 56% of graduates say they are satisfied with life in general. (ANNEX TABLE 3.1b)

We also asked respondents to tell us how satisfied they are with the following five items:

- The educational system
- Public transport
- Law and order
- The health care system
- The economic situation

Among these, citizens of the ten new member states are most satisfied with the educational and public transport systems (27-26% satisfied). They are least satisfied with the health care system and the economic situation (only 11% and 7% satisfied, respectively). In the three candidate countries, citizens are most satisfied with public transport (24% satisfied) and least satisfied with the health care system (11%). (ANNEX TABLES 3.2-3.5)

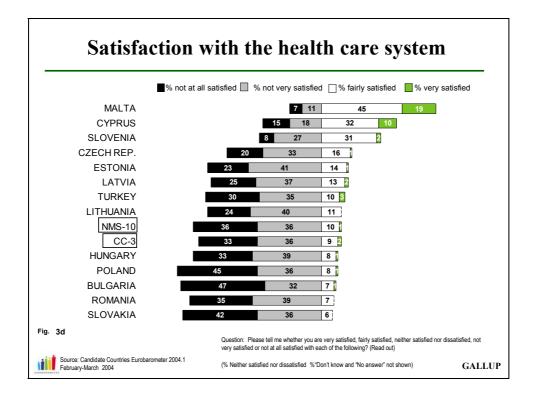

Only 1-2% of the accession and candidate countries are very satisfied and a further 9-10% are fairly satisfied with the health care system. The total proportion of satisfied respondents in this area was 11% in both groups of countries.

On the other hand, dissatisfaction reached 72% among the new member countries and 69% among the candidate countries.

Only in Malta and Cyprus was a majority of those respondents found who were satisfied with the health care system: in Malta 64% were satisfied and 18% dissatisfied, and in Cyprus 42% were satisfied and 33% dissatisfied with the system Slovenia is largely split on this matter: 33% are satisfied while 35% are dissatisfied with their healthcare system.

Yet, elsewhere, the dissatisfied respondents significantly outnumbered the satisfied ones when it came to the heath care system. In these countries (ten out of thirteen) only 6-17% of the population feel satisfied with their healthcare system, while an enormous 53-81% are dissatisfied in this respect.

The most discontented with their health care system are the Polish (81% dissatisfied), Bulgarians (79%), Slovakians (78%), and Romanians (74%). (ANNEX TABLE 3.6a)

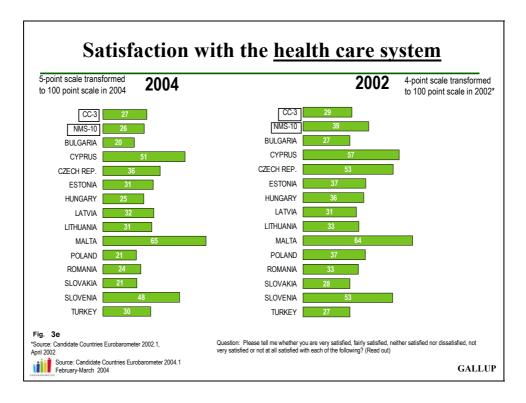

The 2002 Eurobarometer survey also studied satisfaction with one's health care system. At that time, however, the question was examined via a 4-point scale which did not include a middle value. The current survey, however, utilizes a 5-point scale which includes a middle value ("Neither satisfied nor dissatisfied").

Thus, we provide comparability between the two studies by transforming both scales to point values between 0 and 100. Please note that the validity of this comparison is limited because of the different question wording, so the forthcoming results are rather illustrative than indicative of real progress or decline.

In the three countries that remained candidates for joining the EU satisfaction with the health care system decreased from 29 to 27 points on the 100-point comparability scale (this change is not significant). On the other hand, in the NMS-10 zone, satisfaction with the health care system decreased markedly, from 39 points to 26.

Satisfaction with the health care system decreased most in the Czech Republic (17 points), Poland (16 points), and Hungary (11 points). In another six countries, (Bulgaria, Cyprus, Estonia, Romania, Slovakia and Slovenia) satisfaction with the health care system decreased by 5-9 points. We did not find a significant increase in satisfaction anywhere; the minimal, 1-3 point increase in Latvia, Malta and Turkey are well within the error range that we can assume to such comparisons.

Those under the age of 25 and over the age of 55 are more satisfied with the health care system (12%) and 13%, respectively) than middle-aged groups are (9-11%). Among employment groups, housepersons (16%) and the self-employed (12%) are most satisfied. Managers prove to be the least satisfied with the health care system: only 6% are satisfied. (ANNEX TABLE 3.6b)

Those who ended their education at the age of 15 are somewhat more satisfied with health care (13%) than those who have spent more time in education (10%).

We are also interested in respondent's predictions about their future feelings on these matters. We asked citizens to predict whether or not they will be more or less satisfied in two years time. Concerning the health care system, 25% of the new member states of the EU expect to be more content in two years time, while 15% expect to be less satisfied.

As we can see, current satisfaction with the health care system among a majority of the new member states is not very high, and shows a tendency towards falling contentment. With this in mind, therefore, it is quite notable that one-sixth of the accessing population expects further disappointment in their healthcare system in the future.

In the three candidate countries we find a slightly great percentage predicting falling satisfaction in their health care system (17%) as well as slightly more who predict increased satisfaction (31%).

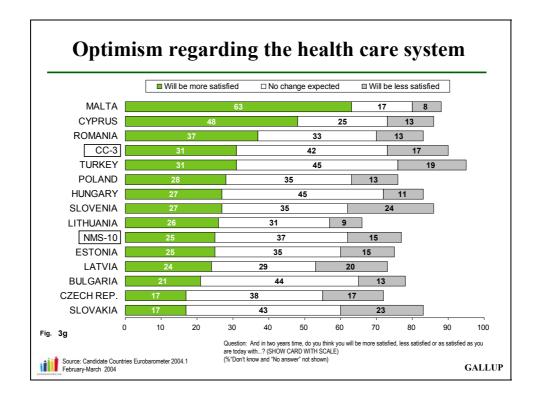

| NMS-10 vs. CC-3 comparison | | | | | |
|-------------------------------------|--------|-----------|------------|--------|---|
| | % Less | satisfied | % More sat | ISTIEC | _ |

| | CC-3 | 14 | 34 | | |
| The health care system in (COUNTRY) | NMS-10 | 15 | 25 | | _ |
| ig. 3f | CC-3 | 17 | 31 | | _ |

Respondents are most optimistic about their future satisfaction with life in general. Among the population of the new EU member countries 31% expect that in two years time they will be more satisfied with life in general, and only 9% predict that they will be less satisfied with their life in general. In the three countries hoping to join the Union at a later time, 37% believe that they will be more satisfied with life in general in two years time, and 12% predict they will be less satisfied. (ANNEX TABLE 3.7a)

The two aspects of life that promote the least hope for the future are the economic situation and the health care system.

An absolute majority of the population (63%) in Malta and a relative majority of the population (48%) in Cyprus expect to be more satisfied with the health care system in two years time than they are now. In most countries people dominantly expect no change, and among those who do not forecast stability. the optimists outnumber the pessimist by a convincing margin.

The states least likely to expect future improvement in the health care system are the Czech Republic. Slovakia (both 17%), and Bulgaria (21%). It is only Slovakia, where those expecting decreased satisfaction in the next two years significantly overwhelm those who predict improvement.

Men look at the future of the health care system more optimistically than women do: 32% of men believe that they will be more satisfied with the health care system in two years time, while only 25% of women share this expectation.

Hope for an improved health care system in two years time falls with the advance of age. Among those younger than 40 years, 31-32% expect improvement, while only 29% in the 40-54 years age group, and an even smaller proportion, 23% among those above 55 years feel likewise.

Considering occupational groups, the most optimistic in this respect are the self-employed (35% predict more satisfaction in two years time) and managers (31% predict more reasons to be satisfied in two years). The retired are the least likely to expect that they will be more satisfied in two years time (22%). (ANNEX TABLE 3.7b)

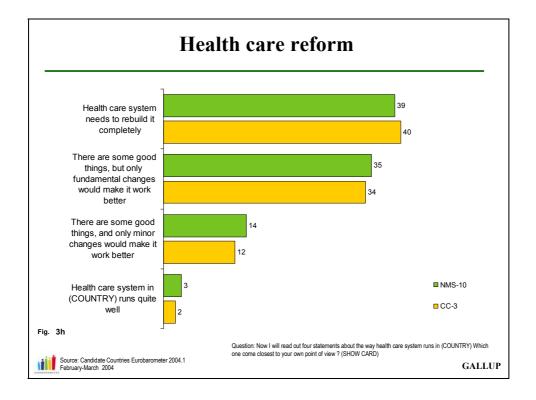

Among the respondents with the highest level of education, 31% believe that they will be more satisfied with health care in two years time. Yet only 27-28% of those with less education share this feeling.

To better understand each respondent's feeling about the health care system in their country we asked each to select, from the following list, the statement that best described their opinion on the matter.

- On the whole, the health care system in (OUR COUNTRY) runs quite well
- There are some good things in the way health care in (OUR COUNTRY) runs, and only minor changes would make it work better
- There are some good things in the way health care in (OUR COUNTRY) runs, but only fundamental changes would make it work better
- Health care system in (OUR COUNTRY) runs so badly that we need to rebuild it completely

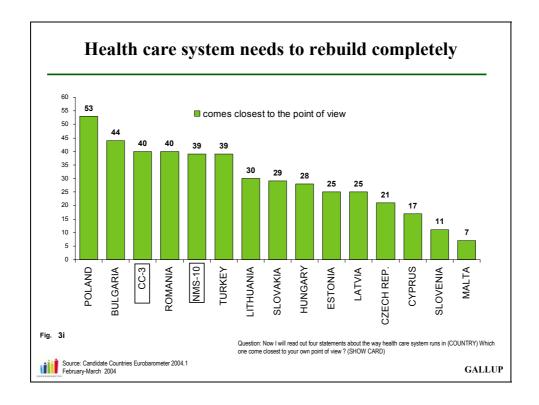

Thirty-nine percent of the citizens in the new EU member states and 40% in the candidate countries said that the health care system should be completely rebuilt. A further 35% and 34%, respectively, believe that although there are some redeemable qualities, only fundamental changes would make the system work better. Therefore three-fourths (74%) of both the new member countries and the candidate countries population feel that fundamental changes are required within their countries' health care system. (ANNEX TABLE 3.8a)

Only 3% of the population of the new EU member countries feel that on the whole the health care system runs quite well in their country. A mere 2% share this view among the three EU hopefuls.

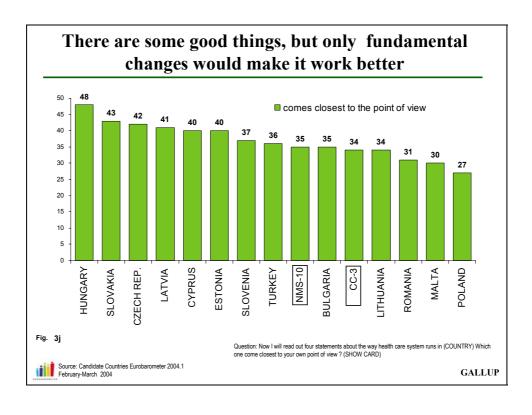

The conviction that the health care system in their country needs to be completely rebuilt is most believed by the Polish (53%), Bulgarians (44%), Romanians (40%), and Turkish (39%).

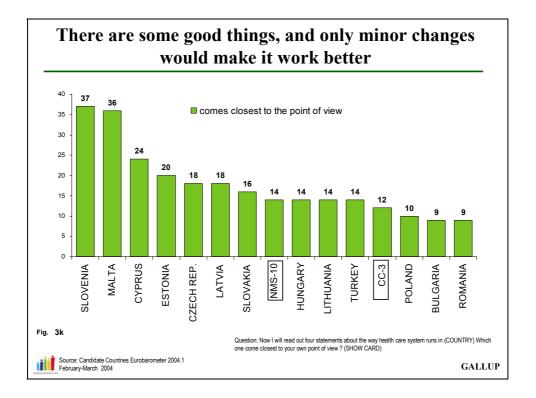

This opinion was least shared by the Maltese (7%), Slovenians (11%), Cypriots (17%) and Czechs (21%).

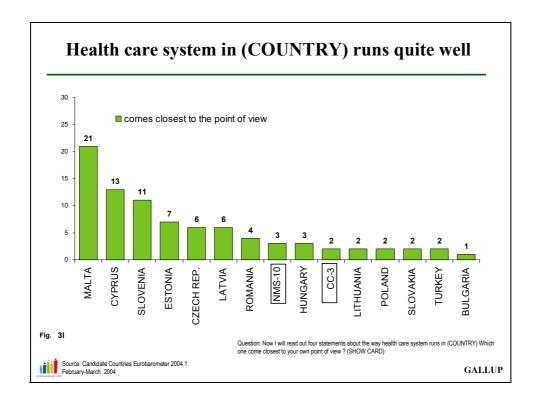

The statement that there are some good things in the way that health care in the country runs, but only fundamental changes would make it work better was most agreed upon by the Hungarians (48%), Slovakians (43%) and Czechs (42%). Polish and Romanians (who support the idea of a complete rebuild) and Maltese (who are outstandingly satisfied with their health care system as it is) are least likely to agree with this statement (27%, 31%, 30% respectively).

The statement that only minor changes are needed to make the health care system in the country work better is most agreed upon by Slovenians (37%) and Maltese (36%). On the other hand, Bulgarians, Romanians (both 9%) and Polish (10%) share this view in very small proportions.

Maltese are most likely to feel (21%) that on the whole the health care system in the country runs quite well. They are followed by a relatively large group who feels likewise in Cyprus (13%) and Slovenia (11%). In the rest of the surveyed countries only 1-7% of the respondents share this opinion.

The statement that the health care system runs so badly that we need to rebuild it completely is most often agreed with by the 40-55 age group (44%), and least by those under the age of 25 (34%).

Manual workers are less likely to feel that the health care system should be completely restructured (37%) than other white collar workers, retired and the self-employed (each 42%). On the other hand, managers share the opinion that fundamental changes are needed (44%), but are less likely than other employees to feel that the system should be completely recreated (39%).

The proportion of those according to whom only minor changes or no modification at all would be necessary for improvement is greater among the groups not holding a graduate diploma (17%) than among those who have continued studying after the age of 20 or have graduated (13%). (ANNEX TABLE

4. Opinions about the health care system

To specifically understand where complaints with one's healthcare system originate (besides the generally unfavourable output indicators, including morbidity and mortality rates in the accession zone that is reflected by the life expectancies way below the EU-15 average), we formulated six statements about the operation of a health care system, listing some possible structural shortcomings, and asked our respondents to tell us how much they agree with the following:

- People use health care facilities too frequently
- Doctors do not spend enough time with you when you go to them
- Doctors do not spend enough time with you discussing preventive action and healthier lifestyle when you see them
- The government or social insurance should only provide everyone with essential services, such as care for serious diseases, and encourage people to provide for themselves in other respects
- It is impossible for any government or public or private health insurance scheme to pay for all new medical treatments and technology
- Priority should be given to treating young patients rather than old patients

People use health care facilities too frequently

Only 24% of the population of the new EU member countries agree with the statement that "people use health care facilities too frequently", and 52% of them disagree (the rest of the respondents either "neither agree nor disagree" or could not answer the question). (ANNEX TABLE 4.1a)

On the other hand, in the three candidates for joining the Union a relative majority believe that people use health care services too frequently (42%, compared to 34% who disagree).

A majority or relative majority of six out of the thirteen surveyed countries believe that their fellow citizens use health care facilities "too frequently". In another seven countries, on the other hand, the majority believe that it is not true that people use the health care system "too frequently".

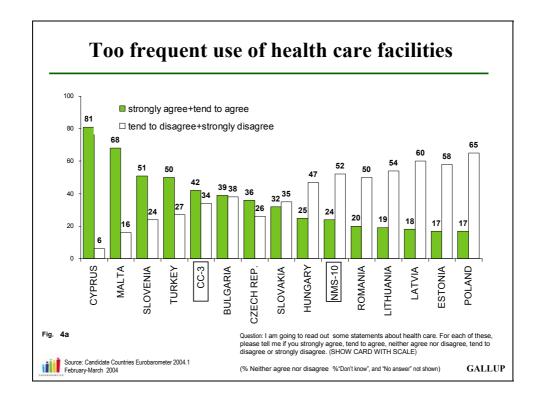

Respondents in the two island countries once under British authority, Cyprus (81%) and Malta (68%), are most likely to believe that people use health care facilities "too frequently". In Malta only 16% and very few, only 6%, of Cypriots disagreed with this statement.

In Slovenia and Turkey the absolute majority also shares the opinion that people use health care facilities "too frequently" (51% and 50%, respectively). Meanwhile 24% of Slovenes and 27% of Turkish do not agree with the statement.

In Bulgaria and the Czech Republic only a relative majority feel that their fellow citizens use health care services "too often". In Bulgaria, 39% agree and 38% disagree (the difference is not significant) with the statement about too frequent use. In the Czech Republic 36% agree and 26% disagree (the difference here is significant).

Slovakians agree with the statement regarding "too frequent" use in a proportion similar to that of the Czechs (32%); nevertheless, those who disagree in Slovakia form a majority (35%) (not a significant difference).

In the six remaining countries (Hungary, Romania, Poland and the three Baltic countries) a decisive majority of the population does not agree that health care facilities are overused (47-65%). In these countries the proportion of those who agree that there is "too frequent" a use of the health care system falls between 25-17% only.

We did not find a significant difference between women and men in this respect. However, there are significant differences to be found among age groups. For all thirteen surveyed countries, among those younger than 40, approximately identical proportions agreed and disagreed with this statement: 38-38% in the 15-24 age group, and 35-39% in the 25-39 age group.

On the other hand, those between 40 and 54 disagreed with the statement regarding "too frequent" use in a significantly higher proportion (34% agree and 44% disagree) than the younger age groups. Among those over the age of 55 the proportion who disagrees reaches 47% while those in agreement lie at only 28%.

Considering occupational groups, the self-employed and house-persons are the most likely to agree that there is "too frequent" use of the system (40% and 46%, respectively). The statement was refused in the highest proportion by the retired (50%) and managers (52%).

Those who finished their education at the age of 15 or earlier agreed with the statement in a significantly higher proportion (39%) than those with more education did (29-30%). Among respondents with less education, disagreement reached 38%, while among those with higher levels of education disagreement fell at 46-47%. (ANNEX TABLE 4.1b)

Doctors do not spend enough time with their patients

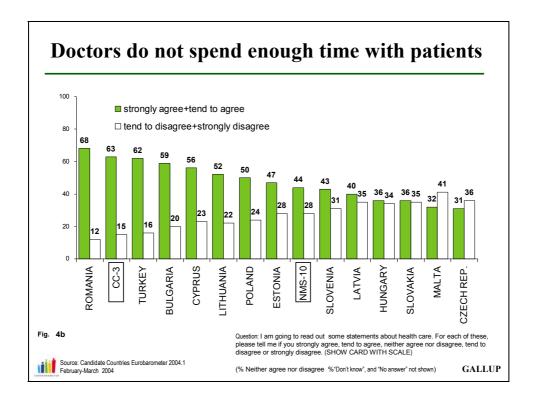

A majority of those in the three candidate countries agree that doctors do not spend enough time with their patients. In Romania 68% of the respondents, in Turkey 62%, and in Bulgaria 59% agree with this position. (ANNEX TABLE 4.2a)

Less among the ten new EU member countries fell likewise. Here 44% of the population agrees that doctors do not spend enough time with their patients. Nevertheless, this is the majority opinion even in these countries, as only 28% disagree.

The neighbouring countries of Hungary and Slovakia are generally split in opinion on this matter. Here the statistical difference between those who agree and those who disagree that doctors do not spend enough time with patients is not significant: in Hungary 36% agree and 34% disagree, in Slovakia 36% agree and 35% disagree.

In only two countries the majority disagrees with this statement. These two countries are Malta (32% agree 41% disagree) and the Czech Republic (31%-36%).

In these four countries (Hungary, Slovakia, Malta and the Czech Republic), therefore, the population is relatively more satisfied with the time their doctor spends with them as patients than are citizens of the other nine countries. In all the other countries a significant majority feels that doctors do not spend enough time with their patients.

Women are more likely than men to believe that doctors do not spend enough time with them (56% vs. 52%). Looking at age, however, we did not find any significant difference between age groups: 54% of the respondents in all age groups believe that doctors do not spend enough time with their patients. (ANNEX TABLE 4.2b)

It most likely also mirrors the sentiments of women that house-persons are most likely of all occupational groups to feel that doctors do not devote enough time to them (63%). Managers are least likely to share this view (46%). On the basis of our findings it is not possible to know whether doctors actually spend more time with those possessing higher social position, such as managers, or if these individuals are simply more satisfied with the attention they receive.

With an increase in educational attainment complaints that doctors do not devote enough time fall: 59% of the least educated, 51% with secondary education, and 50% with higher education feel they do not receive enough of their doctor's attention.

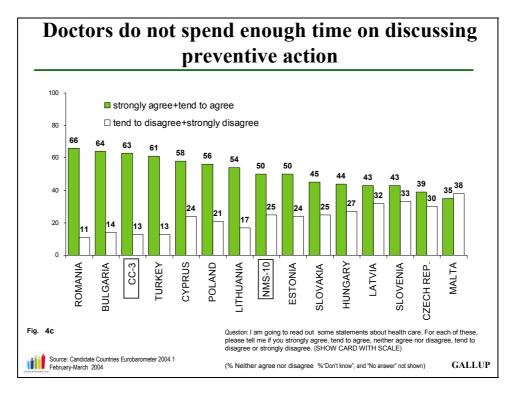

Again, it is difficult to say whether these results reflect more real time with medical personnel or whether people with greater education are more likely to understand the time limits imposed on their doctors.

Doctors do not spend enough time discussing preventive action with you

Exactly half (50%) of the population in the new EU member countries agree with the statement that "Doctors do not spend enough time with you discussing preventive action and healthier lifestyle when you visit them". One-fourth (25%) of this population disagrees. (ANNEX TABLE 4.3a)

Significantly more agree (63%) and significantly less disagree (13%) with the statement in the three candidate countries. These three countries (Romania, Bulgaria, and Turkey) were most likely to agree that their doctors did not sufficiently discuss preventive care (61-66%).

More than fifty percent agree in Cyprus (58%), Poland (56%), and Lithuania (54%) agree as well. The Czechs (39%) and Maltese (35%) are least likely to agree to the statement. What's more, Malta is the single country where the proportion of respondents disagreeing (38%) surpasses that of those who agree.

We find that social and demographic tendencies for agreement to this statement mirror those of the previous.

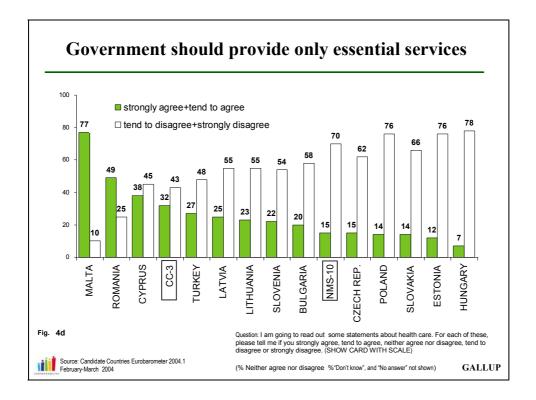

Women (59%) are somewhat more likely than men (55%) to believe that doctors do not properly inform them about prevention and a healthy lifestyle. We did not find significant differences in opinion among age groups. (ANNEX TABLE 4.3.b)

Similarly to the previous statement, horse-persons were the most likely to feel that doctors do not spend enough time with them in discussing preventive measures (63%). Again, managers were the least likely to share this view (51%).

As one's educational attainment increases dissatisfaction with the time one's doctor spends on preventative education falls. While 60% of the least educated agree that their doctor does not spend enough time on this subject, slightly less (55%) of those with more education feel similarly.

The government or social insurance should only provide essential services

The vast majority (70%) of the population of the ten countries joining the Union in May 2004 does not believe that the government should provide only essential services. Only 15% agree with this statement suggesting self-reliance ("The government or social insurance should only provide everyone with essential services, such as care for serious diseases, and encourage people to provide for themselves in other respects"). On the other hand, the population of the three countries which are candidates for joining the European Union in the future have a slightly different view on the issue: "only" 43% of them disagree, while 32% agreed. (ANNEX TABLE 4.4a)

Self-reliance on the subject of health care and the "withdrawal" of the government was supported by the majority only in Malta (77%) and Romania (49%). Also in Cyprus, compared to the other nations, a higher proportion of the population (38%) supported the idea of the government withdrawing from health care. In the rest of the countries, the proportion of respondents disagreeing with this was significantly greater than that of support.

Hungarians are most likely to support the "withdrawal "of government from health care (78%), and only 7% of them support the idea of self-reliance in the area of health care. A decrease of the role of the government was also refused by a large number of the Polish (76%), Estonians (76%), Slovakians (66%), and Czechs (62%).

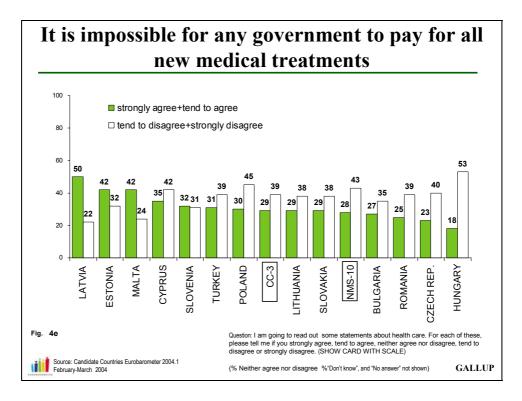

Respondents over the age of 40 reject the withdrawal of government in the area of health care in a somewhat higher proportion than other ages. Among the population under the age of 40 25-25% agree with this sort of self-reliance, and 49-55% reject it. On the other hand, among those over 40 years, only 23-24% agrees but 58-60% refuses the idea diminishing government participation. (ANNEX TABLE 4.4b)

Other white collar workers refuse the withdrawal of government from health care in the highest proportion (67% oppose and only 18% support). This idea is the most accepted by house-persons: nevertheless, the decisive majority remains opposed (49% oppose, 28% support).

Health insurance can't to cover all new treatments and technology

Forty-three percent of the new EU member countries population disagrees and only 28% agrees with the statement that "It is impossible for any government or public or private health insurance scheme to pay for all new medical treatments and technology". In the three countries joining the Union at a later time 39% disagree and 29% agree. In only three countries did a relative majority support the statement: Latvia (50%), Estonia (42%) and Malta (42%). (ANNEX TABLE 4.5a)

The statement was opposed in an outstandingly highest proportion by respondents in Hungary (53%), where only 18% of the population agreed. If we consider that Hungarians also refused a curbing of the government's role in health care, then we can establish that the Hungarian public not only expects government to have an increased role in health care, but also holds rather high expectations in this area.

Among respondents younger than 25, opinions are rather balanced: 31% agree with the above statement, while 35% refuse it. With the advance of age agreement falls and disagreement grows. Among the respondents over the age of 55 those in agreement dissolved to 23%, while those disagreeing grew to 44%. (ANNEX TABLE 4.5b)

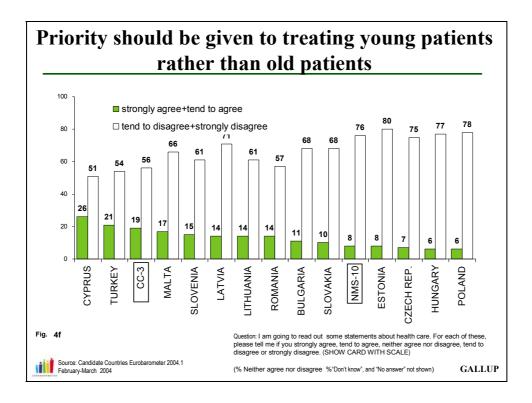

The unemployed and the retired least identified with the statement: only 24% and 23%, respectively, agreed with this idea. In the other employment groups, however, 28-36% agreed with the above statement.

Parallel to an increase in education, support for this statement grows. Only 25% of respondents who left education at the age of 15 agree with the statement, while 44% of them disagree. Among those who studied until the age of 19, 28% agree and 41% disagree. On the other hand, in the case of respondents who continued education after the age of 20, the proportion of agreement and disagreement remain equal (36-36%).

Priority should be given to treating young patients rather than old patients

A full 76% of the population of the new EU member countries disagree and only 8% agree with the notion of that "Priority should be given to treating young patients rather than old patients". The statement was somewhat more acceptable among the three candidate countries: 56% opposed, but 19% supported it.

Giving young patients priority over the older ones was most acceptable in Cyprus (26%) and Turkey (21%). The proposal was opposed in highest proportion in Estonia (80%), Poland (78%), Hungary (77%) and the Czech Republic (75%). (ANNEX TABLE 4.6a)

We do not find significant differences between the two genders for this item. However, unsurprisingly, there are significant differences between age groups: 17% of those younger than 24 years agree, while 14-15% of the 25-54 age group, and only 10% of those above 55 years agree. (ANNEX TABLE 4.6b)

Looking at an employment based breakdown, we see that in the house-persons are most likely to agree that the youngest should enjoy priority for area of health care services (21%). On the other hand, among managers and other white collar workers, only half of this percentage a share this opinion (10%). Those who are retired are least likely to support this idea (9%).

Respondents with less education (those leaving education at or before the age of 15) support this proposal more so (17%) than those continuing studies after this age (11%).

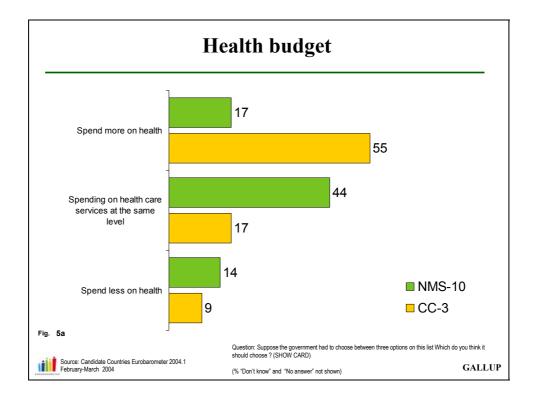

5. Health care financing

In relation with the financing of the health care system we asked respondents the following question: "Suppose the government had to choose between three options on this list. Which do you think it should choose?

- 1 Reduce taxes or social insurance contributions and spend less on health care services
- 2 Keep taxes and spending on health care services at the same level as now
- 3 Increase taxes or social insurance contributions and spend more on health

The ten new EU member countries and the three candidate countries hold radically different opinions about what the government should do in such a dilemma.

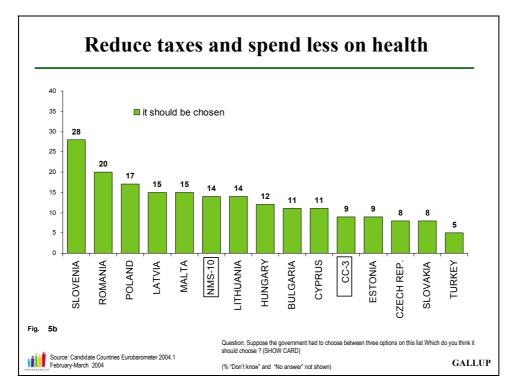

A relative, but convincing, majority (44%) in the new member countries would support their government in keeping current tax levels and spending the same on health care as it does now - so in these countries citizens rather blame the health care system with misusing the resources that are made available to it. For the two other options, only 17% support spending more on health care even at the cost of a tax increase, and only 14% favour spending less on health care. (ANNEX TABLE 5a)

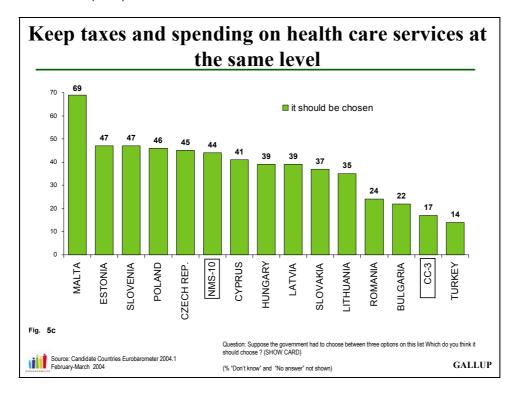

The population of the three candidate countries feels differently. The absolute majority (55%) here would support, even by way of tax hike, an increase in healthcare spending, which means that these citizens (predominantly the Turkish respondents) acknowledge that they can't hope for better care unless they pay more contributions to the state that operates it. Keeping the current level of health care services and taxes is the most favoured option for only 17%. And a mere 9% feel that less should be spent on health care in order to reduce taxes.

Within this group, however, we observed significant differences. While 71% of Turkish support, (even at the cost of tax increase) more spending on health care, only 26% of Bulgarians and 23% of Romanians share this opinion.

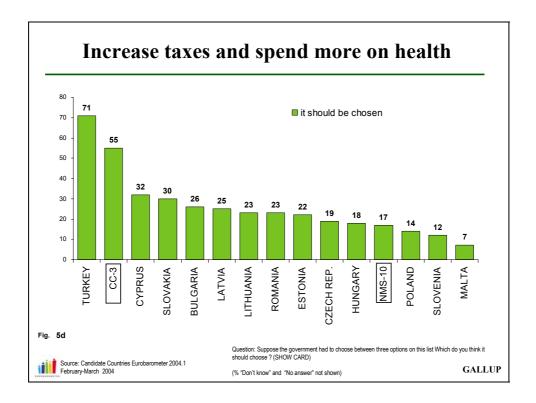

Slovenians are most likely to support (28%) a decrease in health care spending in order to reduce taxes. Romanians and Polish also, compared to others, feel overtaxed: 20% in Romania and 17% in Poland would support decreased healthcare spending in order to curb taxes. This possible government policy was the least supported by Turkish (5%), Slovaks (8%), Czechs (8%) and Estonians (9%).

The preference for keeping current levels of taxes and health care services is supported in an outstandingly high proportion in Malta (69%). Yet this possibility is generally favoured by a relative majority of all 2004 members. In this respect only minor differences were found among the new members. Estonians and Slovenians (both 47%) supported this option the most, while Lithuanians (35%) and Slovakians (37%) did so least.

The proposal that, by way of tax increase, health care spending should be increased was most supported by Turkish respondents (71% of them prefer this option). Additionally, Cypriots (32%) and Slovakians (30%) sponsor this solution more so than do other countries. On the other hand, this government policy of health is least supported in Malta (7%), Slovenia (12%) and Poland (14%).

With an increase in age it is less likely that one will prefer increasing taxes in order to spend more on healthcare. Among those younger than 25 years, 44% would support this solution, 42% of those between 25 and 39, only 34% of respondents in the 40-54 years age group, and only 31% among those over 55. (ANNEX TABLE 5b)

House-persons and the self-employed (54% and 51%, respectively) are more likely to accept a tax increase in order to spend more on health care than are other occupational groups. Managers (16%) and the unemployed (15%) would most prefer that taxes and spending on healthcare were both decreased.

The option of keeping both tax levels and the health care budget unchanged is more preferable to managers and other white collar workers (39% in both groups) than to others.

Among the less educated respondents, significantly more selected the option that even at the cost of tax increase more should be spent on health care (48%) than among those with higher levels of education (29-31%). On the other hand, respondents with higher education attainment are most likely to prefer a tax reduction and reduced health care spending; 13-16% agree with this, while among the population with lower education only 8% share this opinion.

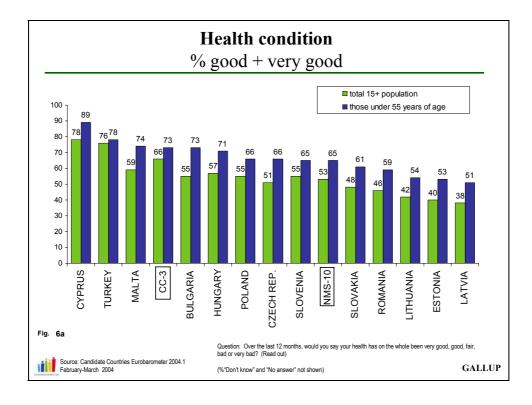

Compared to their less educated counterparts, respondents with higher levels of education more frequently selected the option that everything should remain the same: 34-36% compared to the 22% of those with less education.

6. Satisfaction with own health condition

In the course of the survey we asked respondents to evaluate their health condition on the whole, over the last year: very good, good, fair, bad or very bad. On average, the population of the candidate countries rate their health condition to be better than the citizens of the new members. While twothirds (66%) of the candidate countries' citizens regard their health condition to be good or very good over the past 12 months, only slightly more than half (53%) of the new member countries population share this view.

It is worth to note that health satisfaction has a well-documented strong relationship with life satisfaction that is usually markedly stronger than its relation to actual (physical) health status, mortality, or health infrastructure. Our survey confirms this tendency with showing a relatively strong correlation of the reported health status to life satisfaction (0,295 across the board, significant at the 0.01 level). At the same time the correlation of health satisfaction and satisfaction with health care services remains limited (but statistically similarly significant) at the 0,105 level.

Whatever it actually means, Cypriots (78%) and Turkish (76%) are most likely to rate their health condition as good or very good. They are followed by the Maltese, with an almost twenty percentage point lag: 59% said that their health condition was good or very good over the past one year. At the other end of the list we find the three Baltic countries, Latvia (38%), Estonia (40%) and Lithuania (42%). Polish and Romanian respondents were most likely to evaluate their last year's health condition to be bad or very bad (both 18%). FIGURE 6a also indicates that this structure prevails if we focus our investigation to the active population, those with generally less health problems. (ANNEX TABLE 6.1a)

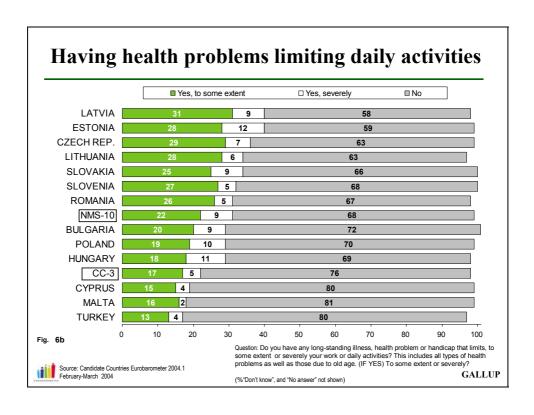

Male, younger and more educated respondents consider their health condition to have been better than female, older and less educated respondents do. Somewhat more than two-thirds (68%) of men consider their health condition to have been good or very good, while a little more than half of women share this view (53%). On the other hand, 17% of women said that in the past one year their health condition was bad or very bad, while only one-tenth (10%) of men consider their health condition to have been similar.

The difference is rather significant between the opinions of the young and the old: one-fourth (26%) of the 15-24 years age group regard their health condition as very good, and a further 56% fell it has been good in the last one year before the survey, while among those above 55 only 3% say their health condition was very good in the past one year, and a further 27% say it was good. On the other hand, one-fourth (24%) regard their health condition as bad and 4% very bad among the oldest age group in the past 12 months as opposed to the youngest among whom only 3% say it was bad and 1% that it was very bad. We do not find such significant differences among the education groups; nevertheless, the more educated find their health condition to be slightly better than their less educated peers. While among the respondents who stopped education at the age of 15 years 56% say their health condition has been good or very good, and 17% bad or very bad, among those studying after the age of 20 these proportions are 61% and 10%, respectively. Among the employment groups the self-employed are the most satisfied: 18% say their health condition has been very good, 60% good, and only 3% regard their health condition in the past year to have been bad and 1% very bad. At the same time 27% of the retired say their health condition was bad and 6% say it was very bad over the past one year, while 24% of them feel it was good, and 3% very good. (ANNEX TABLE 6.1b)

Having health problems

The population of the new member countries does not only see their own health condition to be worse than the citizens of the candidate countries, but also more among them say they have long-standing illness, health problem or disability that limits, to some extent or severely, their work or daily activities (including all types of health problems as well as those due to old age). Of the new member countries, 22% accounted minor disabilities, while a further 9% report living with a major disability. In the candidate countries 17% reported minor, and a further 5% major disability.

At the top of the list we find the citizens of those countries that were the most critical about their health condition: 31% of Latvian respondents reported smaller, and 9% reported severe disabilities. Among the Estonians 28% said to have minor and 12% to have more severe disability. Czechs reported more long term illness and disabilities than Lithuanians did: 29% of them have minor, and 7% have more severe disability problems. In the least proportion Turkish, Maltese and Cypriots reported a long term illness or disability. The problems limiting their work or daily activities were regarded to be minor by 13% and severe by 4% by Turkish, and 16% and 2% of Maltese, respectively, while among the Cypriots 15% regard them to be severe and 4% to be minor. (ANNEX TABLE 6.2a)

Women report a long term illness or disability more frequently than do men: 8% a severe and 21% a minor disability, while among men 5% report sever and 17% a minor disability. It is not surprising that with an advance in age respondents disclose increasing long term illnesses and disabilities: 1% of the 15-24 years age group report a severe, and 7% a minor, disability. On the other hand, among those over the age of 55, 17% of respondents live with a severe disability and 37% with a minor disability or long term illness.

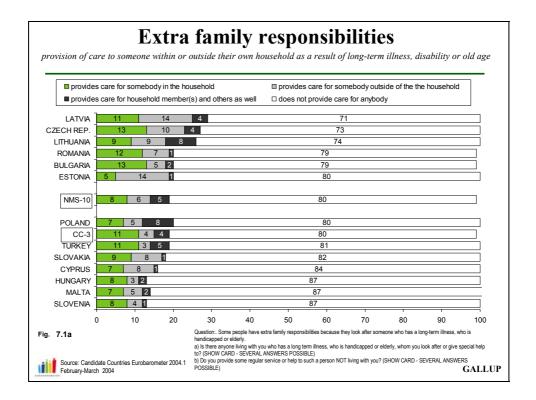

Among other demographics, those highly educated report the least (14%) and the retired the greatest (57%) percent of respondents living with some extent of disability or long term illness. Every fifth respondent (20%) among the retired has a severe health problem. The more educated report health problems less frequently: 15% of the most educated have minor, and 6% have severe health problems, while 23% of the least educated have minor and 9% have severe health problems. (ANNEX TABLE 6.2b)

7. Providing care for those in need

7.1 People providing care

We asked people aged 15 years and over in each candidate country and new member state of the European Union whether they had extra family responsibilities that involved looking after someone with a long-term illness, who is handicapped or elderly.

In the new members, 19% of the respondents told us they have such a responsibility. 8% provide care for someone in the household only, 5% look after somebody within and outside of the household, and 6% have a responsibility that is not in their household. (FIGURE 7.1a) In the candidate countries, out-ofhome care (4+4=8%) is even less common than in-home (11+4=15%).

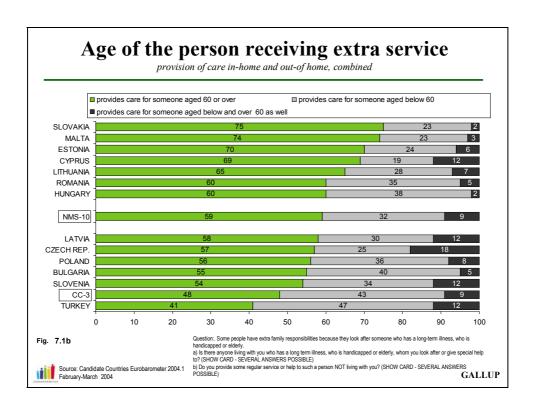

In Latvia only 71% do not take up extra responsibilities and care provision is relatively more frequent in the Czech Republic and Lithuania as well. On the other hand, only about 14-16% of Maltese, Slovenians, and Hungarians are looking after someone who has a long-term illness, who is handicapped or elderly. The Maltese, the Cypriots, and the Poles (all 7%) are the least likely to provide co-residence caring for others.

The majority (41%) of those in the Candidate Region who receive in-home care are not a partner or a child, but are most likely a parent. (TABLE 7.1) 19% take care of a handicapped child or a child with long-term illness, and 26% take care of a partner (husband or wife). A rather significant 19% of those who provide out-of-home care for somebody claimed that this person is not their relative, but the dominant group is again some "other relative" with 63%.

| Table 7.1 Proportion of the different groups receiving care in-home and out-of-home (%, among those who provide care, CC-13) In-home care Out-of-home care | | | | |
|---|-----|-----|--|--|
| partner | 26 | 6 | | |
| child | 19 | 12 | | |
| another relative | 41 | 63 | | |
| non-relative | 14 | 19 | | |
| total | 100 | 100 | | |

FIGURE 4.1b gives us evidence that ageing is not solely responsible for the increased family responsibility of the citizens in the new member countries: on average, 41% of those who provide some special care for a friend or relative, do so for someone below 60 years of age. The elderly (those aged 60 years or older) alone receive only 59% of special care provided by family members, friends or complete strangers in the societies of the accession zone. 40% in Bulgaria and 38% of those in Hungary who have extra family responsibilities take care solely of someone below 60 years of age - which is an indicator of the general health situation as well as the structural problems of the health care in these countries, too.

Among the age groups, those between 40 and 54 years are most likely to care for persons aged 60 or older living elsewhere (7%). Among occupational groups, managers were most likely to report this type of care (9%). Looking after relatives aged 60 or older who are living elsewhere is less common (3%) among the respondents with the least education than among those who studied past the age of 20 (8%).

Respondents between 15 and 54 years are most likely to take care of another relative aged 60 or older who lives in their household or elsewhere, while the oldest age group (above 55) most often care for their spouse aged 60 or above living at home (8%).

As a rule of thumb, we can assume that most of the "elderly relatives aged 60 or above", who are most often cared for, are older parents or grandparents of the respondents. In light of this, it is interesting to look at opinions regarding who should primarily pay for taking care of elderly parents. (ANNEX TABLES 7.1a-7.2b)

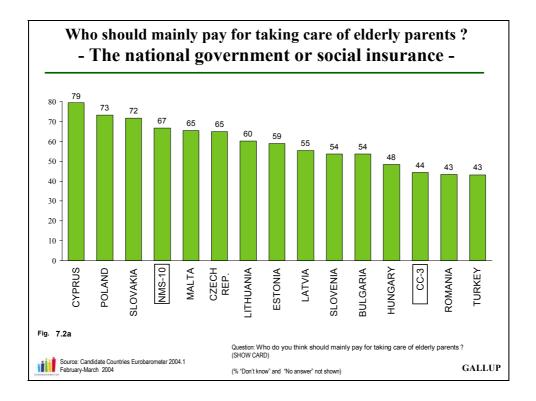

7.2 Paying to take care of elderly parents

Increasing longevity requires additional resources to ensure quality life for persons in advanced ages. when they are less able to support themselves. 67% of those in the new member states think that the costs related to increasing longevity should be borne by the state or other public authority, so that the costs are shared by the whole society.

In the new member countries those who urge government participation are in clear majority, however in the candidate countries those who underline the responsibility of the child constitute a significant proportion of the society as well. Two-thirds of the new members' citizens share the view that the government should provide primary financial assistance for the care of elderly parents, while less than half (44%) of the candidate countries population agree with this.

While 41% of the candidate countries hold the opinion that the cost to care for older parents should be assumed by their children, only 16% of the new member countries population feel likewise. The difference is remarkably significant, and does suggest a decreased level of traditional family solidarity in the new members, where somewhat more people say that elderly parents should look after themselves: 8% agree in the new member countries, and 5% in the candidate countries. The assumption that these costs should be borne by the regional or local government received 5% support in the accession and 6% support in the candidate countries.

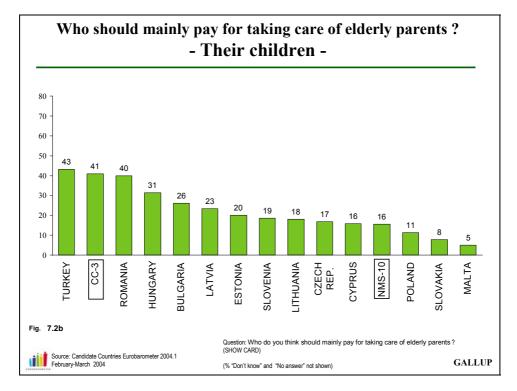

The more traditional, family-centred attitude of the candidate countries is shown in the individual country analysis as well (see FIGURE 7.2a on the next page). The participation of national governments is supported by only 43% of both Turkish and Romanians, and 54% of Bulgarians. These three countries represent the least support for government financial assistance for care of elderly parents. Among the ten accessing countries, only the Hungarians share this opinion in a similar proportion (48%). We found a similar tendency regarding the role of the child: the Turkish (43%) and Romanian (40%) respondents are most likely to say that it is the responsibility of the child to support elderly parents, followed by Hungarians (31%) and then Bulgarians (26%). (ANNEX TABLE 7.3a)

The opposing attitude is represented most clearly by the population of the two island countries and the other three Visegrád countries. Government support is regarded necessary by nearly four-fifths (79%) of Cypriots, 73% of Polish, 72% of Slovakian, and 65% of both the Maltese and Czech population. The statement that children should support their elderly parents is agreed least by Maltese (5%), Slovakians (8%), and Polish (11%), Cypriots (16%), and Czechs (17%). Therefore, those most supportive of government contributions to parents care are least likely to believe that such care should be the children's responsibility.

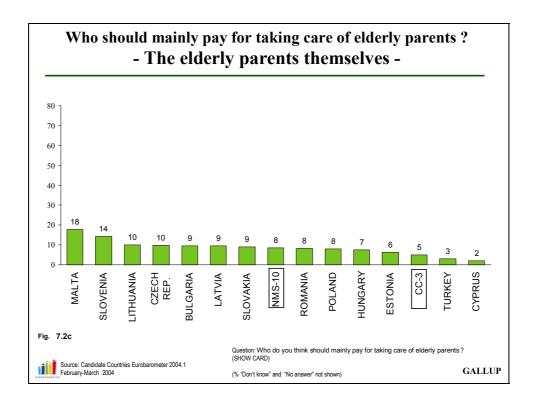

Older respondents, more frequently than the younger ones, said that the government should pay for this care: while half of the 15-24 years age group said that the government should pay, 58% of the 40-54 years age group share this opinion. Among the respondents over the age of 55, 56% support this idea. Among employment groups, managers (63%), white collar workers (62%) and the unemployed (60%) are most likely to believe that the cost of caring for elderly parents should be covered by the government. House-persons are least likely to agree (47%). The more educated the respondent, the more probable it is that he agrees with the necessity of government support: less than half (48%) of the least educated, and almost two-thirds (62%) of the most educated share this opinion. (ANNEX TABLE 7.3b)

On the other hand, the youngest are most likely to believe that children should support their elderly parents: one-third (33%) of the 15-24 years age group and only one-fourth (25%) of those over 40 think so. Support of this statement is also greater among the less educated than among the more educated: 36% of those finishing education at the age of 15 think that it is the child's responsibility to support his elderly parents, while in the most educated group 22% share this opinion. Among employment groups house-persons are most likely (38%) to believe that the elderly should be supported by their children.

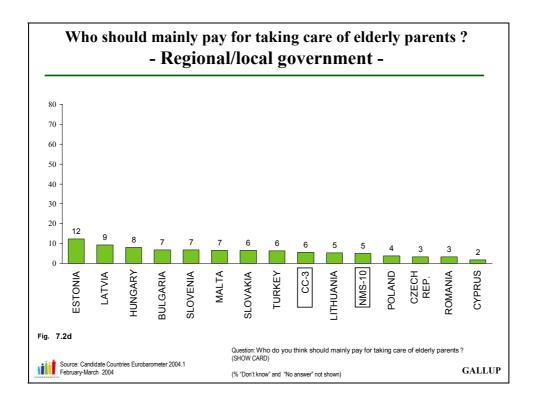

The statement that elderly parents should pay for their own care themselves received the greatest support in Malta: 18% of the Maltese share this view. Another 14% of Slovenians and one-tenth of Lithuanians and Czechs agree. At the other end of the spectrum stands the other Mediterranean island: only 2% of Cypriots say that parents should pay for their own care. They are followed by the Turkish (3%) and Estonians (6%).

Managers are most likely to express the opinion that the elderly themselves should pay (10%), while among house-persons and the unemployed only half of this proportion share this view (5-5%). More educated respondents support this solution more often than other do: while 5% of those leaving education at the age of 15 share this view, 9% of those studying after the age of 20 do so.

The participation of local or regional government is most supported by Estonians (12%), Latvians (9%) and Hungarians (8%). Cypriots favour this solution least frequently; again only 2% regard this to be a good idea. Respondents of Romania and the Czech Republic support this solution only at 3%.

Among the demographic groups, manual workers and those still studying are most likely to support the participation of local governments in financing elderly parents: 7% share this view. More educated respondents supported the role of regional and local governments less so than others: while 6% of the least educated, then 3% of the most educated said that local governments should pay.

7.3 Long-term care services

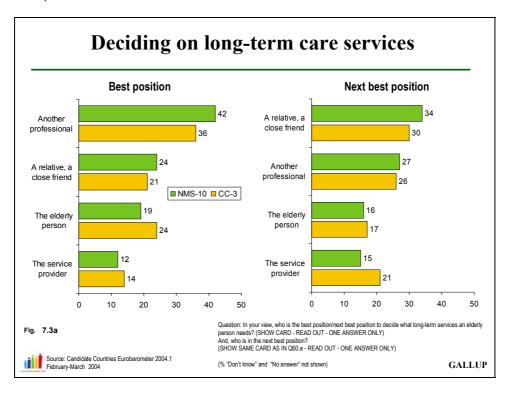

We also asked the respondents who they feel is in the best and the next best position to decide what long term services and care the elderly persons need. The respondents had four options to choose from:

- A relative, a close friend
- The elderly person
- The service provider
- Another professional (doctor, etc.)

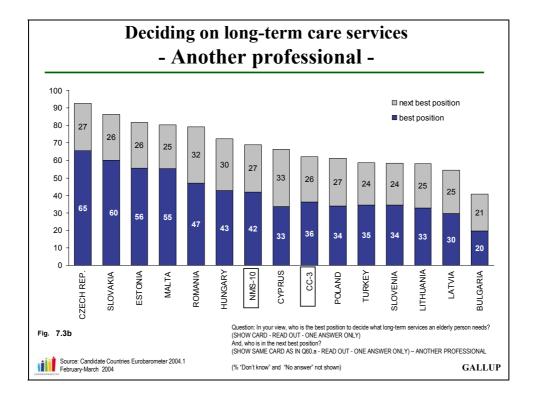

Most of the respondents believe that an independent professional (such as a doctor) is in the best position to make such decisions. In the new member countries 42%, and in the candidate countries 36%, feel that such professionals are best suited to evaluate the situation of the elderly, while 27% of the new member countries and 26% of the candidate countries selected professionals as the next best solution.

In the new members, relatives and close friends were selected second-most often (24%) as those who are in the best position for these decisions. Further, the 2004 members most often selected family and friends as being in the next best position for these decisions (34%). In the candidate countries relatives and friends were also mentioned in the highest proportion as those that are in the next best position to make decisions about the necessary services and care of elderly (30%). The third most selected response is held by the elderly themselves: nearly one-fifth (19%) of the new EU citizens and almost one-fourth (24%) of the candidate population believes that the elderly themselves are in the best positioned to decide what services they need.

Respondents were least likely to respond that service providers are suitable to make decisions on this matter: 12% of the new member countries and 14% of the candidate countries population said these providers are in the best positioned, while 15% of the new member countries and 31% of the candidate countries respondents regard these organisations to be the next best positioned. (ANNEX TABLES 7.4a, 7.5a)

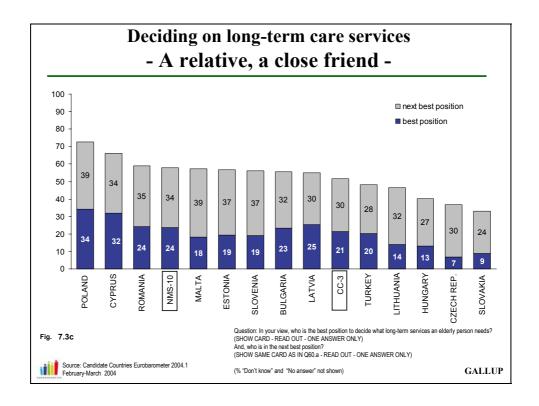

The independent professional was mentioned most often by the Czechs: in the opinion of nearly twothirds (65%) of Czechs a professional can best decide on care. Somewhat more than one-fourth (27%) chose the professional as the next best person for these decisions. Following the Czechs, Slovakians and Estonians regard the professional to be most competent to decide about the necessity of care: 60% and 56% regard the professional to be in the best, and equally 26% of them to be in the next best position. There is only one country where less than half of the respondents selected the independent professional to be the best and the second best positioned person: one-fifth (20%) in Bulgaria believe the professional to be the best positioned, and nearly the same proportion (21%) chose the professional to be the second best.

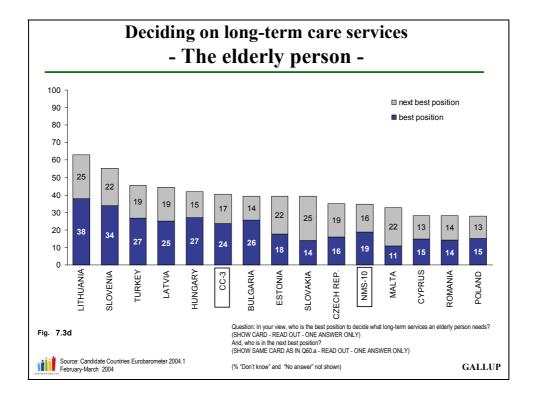

Among demographic groups, those highly educated are most likely to believe that professionals are in the best position to determine what services the elderly need: 44% share this view, and a further nearly one-fourth (24%) list professionals as the second best positioned. The retired mention this option in an even higher total proportion: 69% say that professionals are in the best or next best position to decide in the question. Nevertheless, among the retired, the proportion of those who list professionals in the first place is somewhat lower (41%). (ANNEX TABLES 7.4b, 7.5b)

Polish respondents were most likely to mention relatives and close friends as the best (34%) or second best (39%) positioned persons. Next the Cypriots mentioned relatives and friends in the largest proportion (32% as the best and 34% as the next best positioned persons). These proportions are also rather high, 24% and 35%, respectively, in Romania. On the other hand, only one third of Slovakian respondents mention relatives: 9% believe that relatives are able the best to determine what services do the elderly need, and 24% say relatives are positioned as the second best in this issue.

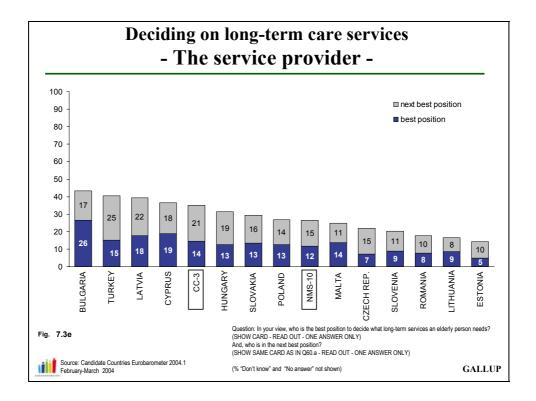

Among demographic groups, the unemployed are most likely to regard relatives and friends as the best or next best positioned for deciding on elderly care (60%). Here is the highest proportion of those, who think relatives and friends are in best position to decide: 28% of the unemployed share this opinion. Managers also consider the position of relatives and friends to be the best or the second best for such decisions: 18% mentioned relatives in the first place, and one third in the second, that is, 51% of managers mentioned this group when answering the question.

Lithuanians regard the elderly themselves to be most capable to decide about their necessary services: in the opinion of 38% of Lithuanians the elderly themselves are in the best position, while one-fourth (25%) say that they are in the second best position. The list ends with the Cypriots, Romanians and Polish: in these three countries 28% mentioned the elderly themselves when responding to the question (15% and 14% as the best, and 13% and 14% as the next best).

House-persons would leave the decision to the concerned in the largest proportion: nearly one-fourth (24%) believe that elderly people are in the best position to determine what type of care they need, while 18% of house-persons regard the elderly to be in the second best position to do so. In the least proportion the unemployed share this view: 19% regard the elderly to be in the best, and 12% regard them to be in the second best position to make decisions in the question.

Bulgarians are most likely to feel that a service providing organisation can best determine what is needed: in the opinion of 26% of Bulgarian respondents these providers are in the best position, while 17% of them regard providers to be in the second best position. Estonians chose this option in the least proportion: only 5% in the Estonian population regard service providers to be the best, and onetenth to be the second best positioned.

This option was chosen most frequently in the self-employed group: 13% believe that service providers are in the best, and 23% believe the providers to be in the second best position to decide what services elderly people need. This opinion is least shared by the eldest respondents in the sample (above 55 years): 11% of them regard providers to be in the best, and 14% in the second best position.

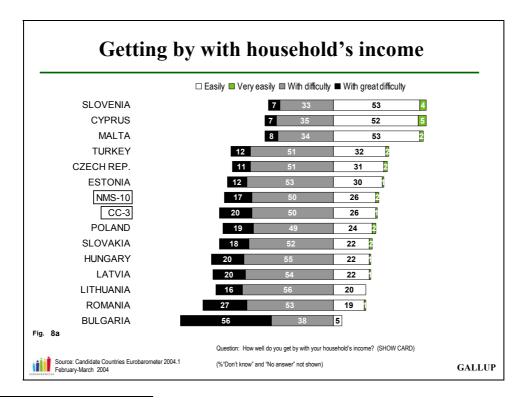

8. Financial situation

We also wanted to know how well respondents get by on their household's income. The population of both the accessing and candidate countries have nearly identical opinions on the issue. For the accessing countries, 28% get by easily (within that 2% very easily), but over two-thirds (67%) have difficulty (within that 17% have great difficulty).

In the candidate countries, 27% get by easily with the household's income (within that, 1% very easily), while 70% of the respondents find it difficult (within that 20% very difficult). Nevertheless it is good news that compared to 2002¹, the proportion of those (in both country grouping) who perceive it to be easy to get by with their income has increased, and the proportion of those who believe the contrary has decreased. The proportion of those who feel that it is easy to get by on their income grew by 6 percentage points in the new member countries and 8 percentage points in the candidate countries, and the proportion of those who find it difficult decreased by 4 percentage points in the new member countries and 10 percentage points in the candidate countries.

We found three countries in which over half of the population consider getting by with their income to be easy: 57% of Slovenes and Cypriots, and 55% of Maltese. Yet at the same time, in Slovenia 40% of the respondents, and in both island countries 42%, find it difficult to get by. Turkey falls in next, with only one-third (34%) of the population getting by easily with their income as compared with the almost two-thirds (63%) who are not. It should be noted, however, that in Turkey, compared to our 2002 survey, there has been an 11 percentage point increase in those who find it easy to get by with the household's income. (ANNEX TABLE 8.1a)

The most dissatisfied are the Bulgarians: only 5% find this task to be easy (and very easy by none), while 94% of them say it is difficult or very difficult. What's more, 56% of the respondents find it very difficult to get by on their income. Following Bulgaria, one-fifth of the population of Romania find the sustenance of the family with the household's income easy (within that 1% very easy), and in the opinion of 53% this is difficult, a further 27% say it is very difficult. The residents of the three candidate countries therefore see the issue rather differently: while the Turkish struggle relatively less, the Bulgarians and Romanians are the least satisfied with their financial situation.

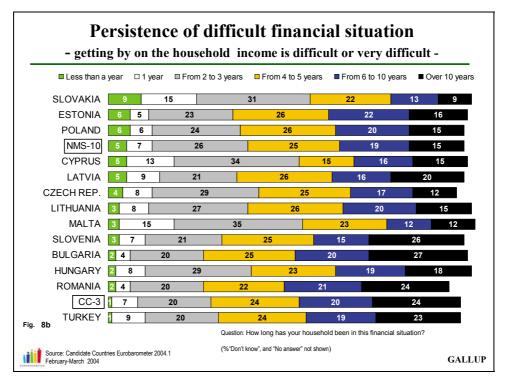

¹ The basis for comparison is the 2002 Spring Eurobarometer survey.

The older respondents find it more difficult to get by on their income. Slightly more than half (52%) of those over the age of 55 get by with difficulty, and another one-fourth (24%) with great difficulty, while somewhat less than half (47%) of the 15-24 age group finds this difficult and one-tenth (10%) very difficult. The proportion of those who find getting by with the household's income easy or very easy is 21% among respondents above 55, and 37% in the 15-24 years age group. Among the employment groups, managers find it easiest to get by with their monthly income (43%), but even among them more than every second (52%) said is difficult or very difficult. The less educated respondents find it more difficult to get by with their income: nearly three-fourths (74%) of those discontinuing education at the age of 15 find this difficult and 23% easy, while 62% of the most educated regard getting by with their income difficult, and 36% easy. (ANNEX TABLE 8.1b)

We also asked our respondents who said they get by with difficulty or great difficulty with their household's income how long their household has been in this financial situation. Respondents in Bulgaria and Romania, who were most likely to respond that they get by with difficulty or great difficulty, say that they have been in a bad situation for the longest period of time. Twenty-seven percent of Bulgarians living in a difficult financial situation say that their household has been in the same financial situation for over ten years, one-fifth (20%) for 6-10 years, and one-fourth (25%) for 4-5 years. Among Romanians finding it difficult to get by with their monthly income, 24% say that the situation has not changed for more than ten years, 21% for 6-10 years, and 22% for 4-5 years. (ANNEX TABLE 8.2a)

Slovenians are most likely to report a good financial situation – at the same time even among the Slovenians living under difficult financial conditions more than every fourth respondent told us that their situation has not changed for over ten years.

Respondents are most likely to have perceived recent change in Slovakia, Malta and Cyprus: in these countries more than half (55%, 53% and 52%, respectively) of respondents living in a difficult financial situation say they have been in this situation for 3 or less years.

Among those in a difficult financial situation, the older respondents see their financial circumstances to be more constant than the younger age groups. While half (51%) of the respondents over 55 years say that their financial conditions have been characteristic of their household for over 5 years, only one-fourth (26%) of those 15-24 sharing their situation say the same. (ANNEX TABLE 8.2b)

9. Summary

In this closing chapter we repeat and summarise the most important findings and results of the study. in all major areas of investigation.

Health care constitutes a very significant problem in the new member states of the European Union. The accessing nations perform rather poorly in most health statistics if compared with the previous member states, and the health care systems in the overwhelmingly post socialists countries suffer from the significant structural shortcomings inherited from a previous era.

Looking at the survey data, indeed, the health care system qualifies as the most important not directly economic (income-related) issue facing the nations in the new member states of the European Union. Citizens feel that unemployment (61%), the economic situation (35%), and the health care system (25%) are the most important problems facing their nation. The condition of the health care system is the most alarming in Hungary (30%). While a quarter of citizens in the new members feel that there health care is one of the priority areas their countries need to deal with, only 15% in the EU-15 zone believes the same.

From a slightly different angle we again find that citizens consider their national health care systems performing quite poorly: only 11% both in the new member states and the candidate countries are very or fairly satisfied with it. Dissatisfaction reached 72% among the new member countries and 69% in the candidate countries. Education, law and order, and public transportation – although with fairly bad marks - all outperform the healthcare systems. In the new members the economic situation is judged even poorer than the health sector (with only 7% being very or fairly satisfied), while in the average of the three candidate countries health comes in the last place with no other major public policy domain gaining a worse evaluation. Only in Malta and Cyprus was a majority of those respondents found who were satisfied with the health care system: in Malta 64% were satisfied and 18% dissatisfied, and in Cyprus 42% were satisfied and 33% dissatisfied with the system Slovenia is largely split on this matter: 33% are satisfied while 35% are dissatisfied with their healthcare system. Yet, elsewhere, the dissatisfied respondents significantly outnumbered the satisfied ones. In these countries (ten out of thirteen) only 6-17% of the population feel satisfied with their healthcare system, while an enormous 53-81% are dissatisfied in this respect. The most discontented are the Polish (81% dissatisfied), Bulgarians (79%), Slovakians (78%), and Romanians (74%).

Correspondingly, in the new members and the candidate countries as well, most respondents feel that foremost the funds allocated to health care should be increased: 73% of the new EU member countries and 70% of the candidates share this view. Second and third to healthcare, 33% of new members believe spending should be increased for social security, and 32% ask for more funds to be spent on education. Housing, roads, public transports, defence and justice, all come way behind the above mentioned issues in terms of budget priority. In the countries that remained candidates after the 2004 enlargement, education comes close to health care as priority spending area (health: 70%, education: 65%).

Although the picture is not that simple as resolving some pressing structural problems could enable health care operating much more cost-efficiently, the ten new EU member countries and the three candidate countries hold radically different opinions about what the government should do in a dilemma of centralising or decentralising health budgets (i.e. whether to raise taxes and health funds, or to decrease taxes with shrinking health budget, or to keep incomes and expenditures at current level). If the question is put in this context, a relative, but convincing, majority (44%) in the new member countries would support their government in keeping current tax levels and spending the same on health care as it does now - so in these countries citizens indirectly blame the health care system with misusing the resources that are made available to it. For the two other options, only 17% support spending more on health care even at the cost of a tax increase, and only 14% favour spending less on health care. The population of the three candidate countries feels differently. The absolute majority (55%) here would support, even by way of tax hike, an increase in healthcare spending, which means that these citizens (predominantly the Turkish respondents) acknowledge that they can't hope for better care unless they pay more contributions to the state that operates it. Keeping the current level of health care services and taxes is the most favoured option for only 17%. And a mere 9% feel that less should be spent on health care in order to reduce taxes.

Investigating the short term outlooks in the major public policy domains, the two aspects of life that promote the least hope for the future are the economic situation and the health care system. An absolute majority of the population (63%) in Malta and a relative majority of the population (48%) in Cyprus expect to be more satisfied with the health care system in two years time than they are now. In most countries people dominantly expect no change; still, among those who do not forecast stability, the optimists outnumber the pessimist by a convincing margin. The states least likely to expect future improvement in the health care system are the Czech Republic, Slovakia (both 17%), and Bulgaria (21%). It is only Slovakia, where those expecting decreased satisfaction in the next two years significantly overwhelm those who predict improvement.

In order to improve the situation, 39% of the citizens in the new EU member states and 40% in the candidate countries said that their health care system should be completely rebuilt. A further 35% and 34%, respectively, believe that although there are some redeemable qualities, only fundamental changes would make the system work better. Therefore three-fourths (74%) of both the new member countries and the candidate countries population feel that fundamental reforms and structural changes are required in order to improve the quality of the service. Only 3% of the population of the new EU member countries feel that on the whole the health care system runs quite well in their country. A mere 2% share this view among the three EU hopefuls.

The conviction that the health care system in their country needs to be completely rebuilt is most believed by the Polish (53%), Bulgarians (44%), Romanians (40%), and Turkish (39%). The call for fundamental changes was most widespread among the Hungarians (48%), Slovakians (43%) and Czechs (42%).

To specifically understand where complaints with one's healthcare system originate (besides the generally unfavourable output indicators, including morbidity and mortality rates in the accession zone that is reflected by the life expectancies way below the EU-15 average), we formulated six statements about the operation of a health care system, listing some possible structural shortcomings, and asked our respondents to tell us how much they agree with each of them.

- Only 24% of the population of the new EU member countries agree with the statement that "people use health care facilities too frequently", and 52% of them disagree (the rest of the respondents either "neither agree nor disagree" or could not answer the question). On the other hand, in the three candidates for joining the Union a relative majority believe that people use health care services too frequently (42%, compared to 34% who disagree.)
- A majority of those in the three candidate countries agree that doctors do not spend enough time with their patients. In Romania 68% of the respondents, in Turkey 62%, and in Bulgaria 59% agree with this position. Less among the ten new EU member countries fell likewise. Here 44% of the population agrees that doctors do not spend enough time with their patients. Nevertheless, this is the majority opinion even in these countries, as only 28% disagree.
- Exactly half (50%) of the population in the new EU member countries agree with the statement that "Doctors do not spend enough time with you discussing preventive action and healthier lifestyle when you visit them". One-fourth (25%) of this population disagrees. Even more agree (63%) and significantly fewer respondents disagree (13%) with the statement in the three candidate countries.
- The vast majority (70%) of the population of the ten countries joining the Union in May 2004 does not believe that the government should provide only essential services. Only 15% agree with this statement suggesting self-reliance ("The government or social insurance should only provide everyone with essential services, such as care for serious diseases, and encourage

people to provide for themselves in other respects"). On the other hand, the population of the three countries which are candidates for joining the European Union in the future have a slightly different view on the issue: "only" 43% of them disagree, while 32% agreed.

- Forty-three percent of the new EU member countries population disagrees and only 28% agrees with the statement that "It is impossible for any government or public or private health insurance scheme to pay for all new medical treatments and technology". In the three countries joining the Union at a later time 39% disagree and 29% agree.
- A full 76% of the population of the new EU member countries disagree and only 8% agree with the notion of that "Priority should be given to treating young patients rather than old patients". The statement was somewhat more acceptable among the three candidate countries: 56% opposed, but 19% supported it.

We asked respondents to evaluate their health condition, too. On average, the population of the candidate countries rate their health condition to be better than the citizens of the new members. While two-thirds (66%) of the candidate countries' citizens regard their health condition to be good or very good over the past 12 months, only slightly more than half (53%) of the new member countries population share this view. It is worth to note that health satisfaction has a well-documented strong relationship with life satisfaction that is usually markedly stronger than its relation to actual (physical) health status, mortality, or health infrastructure. Our survey confirms this tendency with showing a relatively strong correlation of the reported health status to life satisfaction. At the same time the correlation of health satisfaction and satisfaction with health care services remains limited.

However, Cypriots (78%) and Turkish (76%) are most likely to rate their health condition as good or very good. They are followed by the Maltese, with an almost twenty percentage point lag: 59% said that their health condition was good or very good over the past one year. At the other end of the list we find the three Baltic countries, Latvia (38%), Estonia (40%) and Lithuania (42%). Polish and Romanian respondents were most likely to evaluate their recent health condition to be bad or very bad (both 18%).

The population of the new member countries does not only see their own health condition to be worse than the citizens of the candidate countries, but also more among them say they have long-standing illness, health problem or disability that limits, to some extent or severely, their work or daily activities (including all types of health problems as well as those due to old age). Of the new member countries, 22% accounted minor disabilities, while a further 9% report living with a major disability. In the candidate countries 17% reported minor, and a further 5% major disability.

We asked people aged 15 years and over in each candidate country and new member state of the European Union whether they had extra family responsibilities that involved looking after someone with a long-term illness, who is handicapped or elderly. In the new members, 19% of the respondents told us they have such a responsibility. Eight percent provide care for someone in the household only. 5% look after somebody within and outside of the household, and 6% have a responsibility that is not in their household. In the candidate countries, out-of-home care is less common than having extra responsibilities in-home.

Increasing longevity requires additional resources to ensure quality life for persons in advanced ages, when they are less able to support themselves. 67% of those in the new member states think that the costs related to increasing longevity should be borne by the state or other public authority, so that the costs are shared by the whole society. In the new member countries those who urge government participation are in clear majority, however in the candidate countries those who underline the responsibility of the child constitute a significant proportion of the society as well. Two-thirds of the new members' citizens share the view that the government should provide primary financial assistance for the care of elderly parents, while less than half (44%) of the candidate countries population agree with this.

We also asked the respondents who they feel is in the best position to decide what long term services and care the elderly persons need. Most of the citizens believe that an independent professional (such as a doctor) is in the best position to make such decisions. In the new member countries 42%, and in the candidate countries 36%, feel that such professionals are best suited to evaluate the situation of the elderly. Respondents were least likely to respond that service providers are suitable to make decisions on this matter: 12% of the new member countries and 14% of the candidate countries population said that service organisations are in the best positioned to decide.

TABLE 2A PRIORITIES FOR EXTRA SPENDING (% BY COUNTRY)

Question: Here are some items of government spending. Which of them, if any, would be your two highest priorities for extra spending? (SHOW CARD - READ OUT - MAX. 2 ANSWERS POSSIBLE)

- 1. Education
- 2. Defence
- 3. Health care
- 4. Housing
- 5. Public transport
- 6. Roads
- 7. Police, prisons and the courts system (Jurisdiction)
- 8. Social security/social assistance benefits (Social assistance)
- 9. Financial support for companies
- 10. Aid to developing countries/development aid (Development aid)
- 11. None of these (SPONTANEOUS).

The difference between "+" and "-", and 100, is the percentage of ""don't know" and "no answer" (not shown).

TABLE 3.8A OPINION ON HEALTH CARE SYSTEM (% BY COUNTRY)

Question: Now, I will read you four statements about the way health care system runs in (COUNTRY). Which one comes closest to your own point of view? (SHOW CARD - READ OUT - ONE ANSWER ONLY)

- 1. On the whole, the health care system in (OUR COUNTRY) runs quite well **(runs well)**
- 2. There are some good things in the way health care in (OUR COUNTRY) runs, and only minor changes would make it work better (only minor changes needed)
- 3. There are some good things in the way health care in (OUR COUNTRY) runs, but only fundamental changes would make it work better (fundamental changes needed)
- 4. Health care system in (OUR COUNTRY) runs so badly that we need to rebuild it completely (complete rebuild needed)
- 5. Uncertain

TABLE 5A FINANCING THE HEALTH CARE SYSTEM (% BY COUNTRY)

Question: Suppose the government had to choose between three options on this list. Which do you think it should choose? (SHOW CARD - READ OUT - ONE ANSWER ONLY)

- 1. Reduce taxes or social insurance contributions and spend less on health care services (spend less on health)
- 2. Keep taxes and spending on health care services at the same level as now (spend the same on health)
- 3. Increase taxes or social insurance contributions and spend more on health (spend more on health)

C.3 Sample Specifications

Between the 20th of February and the 17th of March 2004, The Gallup Organization Hungary carried out wave 2004.1 of the Candidate Countries Eurobarometer, at the request of the European Commission, Directorate-Generals Press and Communication, and Employment and Social Affairs.

The Candidate Countries Eurobarometer 2004.1 covers citizens of each of the countries that are applying for European Union membership aged 15 and over, with the exception of Estonia, Latvia and Cyprus. In Estonia and Latvia, the survey covered permanent residents aged 15 and over. In Cyprus, the sample covered the territory of the Republic of Cyprus only. The basic sample design applied in all Candidate Countries is a multi-stage, random (probability) one. In each country, a number of sampling points were drawn with probability proportional to population size (for a total coverage of the country) and to population density.

For doing so, the points were drawn systematically from each of the "administrative regional units", after stratification by individual unit and type of area. They thus represent the whole territory of the Candidate Countries Region according to the EUROSTAT NUTS 2 (or equivalent; if there are no such regions, we used NUTS 3 or equivalent regions for sampling) and according to the distribution of the resident population of the respective nationalities in terms of metropolitan, urban and rural areas. In each of the selected sampling points, a starting address was drawn, at random. Further addresses were selected as every Nth address by standard random route procedures, from the initial address. In each household, the respondent was drawn, at random. All interviews were face-to-face in people's home and in the appropriate national language. In countries with significant minorities the respondents had a chance to respond in their mother tongue (in Estonia, Latvia and Lithuania in Russian, and in Romania in Hungarian).

| Countries | Institutes | Number of Interviews | Field Work Dates | Population (x 000) |
|----------------------------|--|-------------------------|------------------------|-----------------------|
| Bulgaria | VITOSHA RESEARCH | 1000 | 25-February - 14 March | 7,891 |
| (Republic of) Cyprus | CYMAR MARKET RESEARCH | 500 | 24-February – 9 March | 689 |
| Czech Republic | THE GALLUP ORGANIZATION, CZECH REPUBLIC / CVVM | 1000 | 21-February - 11 March | 10,226 |
| Estonia | SAAR POLL | 1004 | 21-February -3 March | 1,360 |
| Hungary | THE GALLUP ORGANIZATION, HUNGARY | 1012 | 24-February -14 March | 10,195 |
| Latvia | LATVIAN FACTS LTD. | 1006 | 27-February -11 March | 2,345 |
| Lithuania | BALTIC SURVEYS | 1016 | 20-February - 4 March | 3,475 |
| Malta | MISCO | 500 | 23-February -12 March | 386 |
| Poland | THE GALLUP ORGANIZATION, POLAND | 1000 | 21-February -7 March | 38,632 |
| Romania | THE GALLUP ORGANIZATION, ROMANIA | 1019 | 20-February -8 March | 22,435 |
| Slovakia | FOCUS CENTER FOR SOCIAL AND MARKET ANALYSIS | 1053 | 25-February - 10 March | 5,331 |
| Slovenia | CATI D.O.O. | 1014 | 24-February - 17 March | 1,980 |
| Turkey | KONSENSUS RESEARCH & CONSULTANCY | 1000 | 21-February -11 March | 67,803 |
| Total number of interviews | | 12124 | | 172,748 |

For each country a comparison between the sample and the universe was carried out. The Universe description was derived from population data from national statistics. For all Candidate Countries a weighting procedure, using marginal and intercellular weighting, was carried out, based on this Universe description. As such in all countries, gender, age, region NUTS 2, settlement size, household size, and education level were introduced in the iteration procedure. For international weighting (i.e. CC-13 averages), Gallup applies the official population figures as provided by national statistics. The total population figures for input in this post-weighting procedure are listed above.

The results of the Candidate Countries Eurobarometer studies are reported in the form of tables, datafiles and analyses. Per question a table of results is given with the full question text in English. The results are expressed as a percentage of the total. The results of the Eurobarometer surveys are analysed and made available through the Directorate-General Press and Communication, Opinion Polls of the European Commission, Office: Brey 7/41, B-1049 Brussels. The results are published on the Internet server of the European Commission: http://europa.eu.int/comm/public_opinion/. All Eurobarometer datafiles are stored at the "Zentral Archiv" (Universität Köln, Bachemer Strasse, 40, D-50869 Köln-Lindenthal), available through the CESSDA Database http://www.nsd.uib.no/cessda/europe.html. They are at the disposal of all institutes members of the European Consortium for Political Research (Essex), of the Inter-University Consortium for Political and Social Research (Michigan) and of all those interested in social science research.

Readers are reminded that survey results are <u>estimations</u>, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits (in case of a sample of 1000 people – confidence intervals for N=500 sample are larger):

| Observed percentages | 10% or 90% | 20% or 80% | 30% or 70% | 40% or 60% | 50% |
|----------------------|------------|------------|------------|------------|--------|
| Confidence intervals | ± 1.9% | ± 2.5% | ± 2.7% | ± 3.0% | ± 3.2% |

C.4 Definition and weighted distribution of the sociodemographic and other variables used in crosstabulations

C.4.1 Gender

The sample consists of the following breakdown by gender:

| (1) Men | 48 % |
|-----------|------|
| (2) Women | 52 % |

C.4.2 Age bands

On the basis of their age, respondents are grouped into the following four age bands:

| (1) Aged 15 -24 | 22 % |
|-----------------|------|
| (2) Aged 25 -39 | 28 % |
| (3) Aged 40 -54 | 25 % |
| (4) Aged 55+ | 25 % |

C.4.3 Terminal education age

Terminal education age represents recoded categories of answers to the following question :

"How old were you when you stopped full-time education?"

Respondents are grouped into the following 4 categories :

| (1) respondents who left school at age fifteen or younger | 38 % |
|---|------|
