FLASH EUROBAROMETER 391

"Dual circulation period in Latvia"

TECHNICAL SPECIFICATIONS

On the following days: 2,3,4,6,7,8,10,13,14 of January 2014, TNS political & social, a consortium created between TNS UK and TNS opinion, carried out the survey FLASH EUROBAROMETER 391, 'Dual circulation period in Latvia'.

This survey has been requested by the EUROPEAN COMMISSION, Directorate-General for Economic and Financial Affairs. It is a general public survey co-ordinated by the Directorate-General for Communication ('Strategy, Corporate Communication Actions and Eurobarometer' Unit).The FLASH EUROBAROMETER 391 covers the population of the respective nationalities of the European Union Member States, resident in Latvia and aged 15 years and over. The survey covers the national population of citizens as well as the population of citizens of all the European Union Member States that are residents in Latvia and have a sufficient command of the national languages to answer the questionnaire. All interviews were carried using the TNS e-Call center (our centralized CATI system). Respondents were called both on fixed lines and mobile phones. The basic sample design applied is multi-stage random (probability). In each household, the respondent was drawn at random following the "last birthday rule".

TNS have developed their own RDD sample generation capabilities based on using contact telephone numbers from responders to random probability or random location face to face surveys, such as Eurobarometer, as seed numbers. The approach works because the seed number identifies a working block of telephone numbers and reduces the volume of numbers generated that will be ineffective. The seed numbers are stratified by NUTS2 region and urbanisation to approximate a geographically representative sample. From each seed number the required sample of numbers are generated by randomly replacing the last two digits. The sample is then screened against business databases in order to exclude as many of these numbers as possible before going into field."

Readers are reminded that survey results are estimations, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits:
